

8T20

Multivibrator

**Bidirectional One-Shot
Product Specification**

Logic Products

FEATURES

- Differential Input
Threshold = $\pm 4\text{mV}$
- Pulse Position Error = Typically
 $< 3\text{ns}$
- Max. Input Frequency = 8MHz
- Triggers on Positive and/or
Transitions

APPLICATIONS

- Disc, Tape and Drum Readers
- Digital Communications Receivers
- Signal Conditioners
- Transition Detectors

DESCRIPTION

The Bidirectional One Shot is intended for applications where high speed low level signal processing is required.

The 8T20 is a Monolithic Building Block, consisting of a high speed analog comparator, digital control circuitry, and a precision monostable multivibrator. The differential input threshold voltage is be-

tween $\pm 4\text{mV}$ with respect to the input reference level which may range from -3.2V to $+4.2\text{V}$. For input frequencies up to 8MHz, the device may be condi-

tioned to act as a frequency doubler since it can trigger on both positive and negative input transitions.

LOGIC DIAGRAM

Timing pins permit using this device in a variety of applications where external control over pulse width is desirable. Pulse width (t^W) is defined by the relationship $t^W = C_x R_x \log_2$. Pulse width stability is internally compensated and virtually independent of temperature and V_{CC} variations, thus only limited by the accuracy of external timing components.

An internal resistive divider is available on the chip to provide a voltage of 1.4V (typ.). This output can be connected directly to either of the comparator inputs as a reference voltage when interfacing with TTL outputs.

NOTES:

- For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
- All typical values are at $V_{CC} = 5\text{V}$, $T_A = 25^\circ\text{C}$.
- I_{OS} is tested with $V_{OUT} = +0.5\text{V}$ and $V_{CC} = V_{CC} \text{ MAX} + 0.5\text{V}$. Not more than one output should be shorted at a time and duration of the short circuit should not exceed one second.
- The differential input threshold voltage (V_T) is defined as the maximum DC voltage from the reference level necessary to trigger the one-shot.
- Refer to Figure 5.
- Common mode voltages that are confined within the dynamic range as specified will not cause false triggering of the one-shot.
