

FEATURES

44 V supply maximum ratings
V_{SS} to V_{DD} analog signal range
Low on resistance: <35 Ω
Ultralow power dissipation: < 35 μW
Fast transition time: 160 ns maximum
Break-before-make switching action
Plug-in replacement for DG419

APPLICATIONS

Precision test equipment
Precision instrumentation
Battery-powered systems
Sample hold systems

GENERAL DESCRIPTION

The ADG419 is a monolithic CMOS SPDT switch. This switch is designed on an enhanced LC²MOS process that provides low power dissipation yet gives high switching speed, low on resistance, and low leakage currents.

The on resistance profile of the ADG419 is very flat over the full analog input range, ensuring excellent linearity and low distortion. The part also exhibits high switching speed and high signal bandwidth. CMOS construction ensures ultralow power dissipation, making the parts ideally suited for portable and battery-powered instruments.

Each switch of the ADG419 conducts equally well in both directions when on and has an input signal range that extends to the supplies. In the off condition, signal levels up to the supplies are blocked. The ADG419 exhibits break-before-make switching action.

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

PRODUCT HIGHLIGHTS

1. Extended Signal Range.
The ADG419 is fabricated on an enhanced LC²MOS process, giving an increased signal range that extends to the supply rails.
2. Ultralow Power Dissipation.
3. Low R_{ON}.
4. Single-Supply Operation.
For applications where the analog signal is unipolar, the ADG419 can be operated from a single rail power supply. The part is fully specified with a single 12 V power supply and remains functional with single supplies as low as 5 V.

¹Overvoltages at IN, S or D is clamped by internal diodes. Limit current to the maximum ratings given.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

TERMINOLOGY

V_{DD}

Most positive power supply potential.

V_{SS}

Most negative power supply potential in dual-supply applications.
In single-supply applications, it may be connected to GND.

V_L

Logic power supply (5 V).

GND

Ground (0 V) reference.

S

Source terminal. May be an input or an output.

D

Drain terminal. May be an input or an output.

IN

Logic control input.

R_{ON}

Ohmic resistance between D and S.

I_S (Off)

Source leakage current with the switch off.

I_D (Off)

Drain leakage current with the switch off.

I_D, I_S (On)

Channel leakage current with the switch on.

V_D (V_S)

Analog voltage on terminals D, S.

C_S (Off)

Off switch source capacitance.

C_D, C_S (On)

On switch capacitance.

$t_{TRANSITION}$

Delay time between the 50% and 90% points of the digital inputs and the switch on condition when switching from one address state to another.

t_D

Off time or on time measured between the 90% points of both switches when switching from one address state to the other.

V_{INL}

Maximum input voltage for Logic 0.

V_{INH}

Minimum input voltage for Logic 1.

I_{INL} (I_{INH})

Input current of the digital input.

Crosstalk

A measure of unwanted signal that is coupled through from one channel to another as a result of parasitic capacitance.

Off Isolation

A measure of unwanted signal coupling through an off channel.

I_{DD}

Positive supply current.

I_{SS}

Negative supply current.
