VorceEdge)
SEMICONDUCTOR

## APPLICATIONS

■ Short/Medium Loop: approximately 2000 ft. of 26 AWG, and 5 REN loads
■ Voice over IP/DSL - Integrated Access Devices, Smart Residential Gateways, Home Gateway/Router
■ Cable Telephony - NIU, Set-Top Box, Home Side Box, Cable Modem, Cable PC
■ Fiber-Fiber In The Loop (FITL), Fiber to the Home (FTTH)
■ Wireless Local Loop, Intelligent PBX, ISDN NT1/TA

## FEATURES

■ Integrated Dual-Channel Chip set

- Built-in boost switching power supply tracks line voltage minimizing power dissipation
- Only +3.3 V and +12 V (nominal) required
- Wide range of input voltages (+8 V to +40 V ) supported
- Minimum external discrete components
- 44-pin eTQFP package
- Ringing
- 5REN
- Up to 90 Vpk, Balanced
- Sinusoidal or trapezoidal with programmable DC offset

Subscriber Loop Test/Self-Test

- GR-909 compliant drop test capability in both measurements and pass/fail
- Hazardous Potential
- Foreign Electromotive Force
- Resistive Faults
- Receive Off-hook
- Ringers Test
- Loop Length

■ World Wide Programmability:

- Two-wire AC impedance
- Dual Current Limit
- Metering
- Programmable loop closure and ring trip thresholds

Six SLIC Device States, including:

- Low power Standby state
- On-hook transmission
- Reverse Polarity

ORDERING INFORMATION
An Le78D11 VoSLAC ${ }^{\text {TM }}$ device must be used with this part.

| Device | Package |
| :--- | :--- |
| Le77D112TC | 44-pin eTQFP |
| Le77D112BTC | 44-pin eTQFP (Green package)* |

*Green package meets RoHS Directive 2002/95/EC of the European Council to minimize the environmental impact of electrical equipment.

## DESCRIPTION

The Legerity Le77D11 dual-channel Voice over Subscriber Line Interface Circuit (VoSLIC ${ }^{\text {TM }}$ ) device has enhanced and optimized features to directly address the requirements of voice over broadband applications. Their common goal is to reduce system level costs, space, and power through higher levels of integration, and to reduce the total cost of ownership by offering better quality of service. The Le78D11/Le77D11 is a two-device chip set providing a totally software configurable solution to the BORSCHT functions for two lines. The resulting system is less complex, smaller, and denser, yet cost effective with minimal external components. The Le77D11 Dual VoSLIC device requires only two power supplies: +3.3 VDC and nominally +12 VDC, but can range from +8 to +40 VDC depending on the application. A single TTL-level clock source drives the two switching regulators that generate the required line voltage dynamically on a "per line" basis. Six programmable states are available: Low Power Standby, Disconnect, Normal Active, Reverse Polarity, Ringing and Line Test. Binary fault detection is provided upon application of fault conditions or thermal overload.

## PRODUCT DESCRIPTION

The dual channel Le77D11 VoSLIC device uses reliable, dielectrically isolated, fully complementary bipolar technology to implement BORSCHT functions for short loop applications. Internal power dissipation is minimized by two independent line voltage tracking, buck-boost switching regulators. Two power supplies are required: 3.3 V and a positive supply ( $\mathrm{V}_{\text {SW }}$ ). A TTLlevel clock driven by the Le78D11 VoSLAC device is required for switcher operation. Six programmable states control loop signaling, transmission, and ringing. The Le77D11 Dual VoSLIC device DC current limit ( $\mathrm{I}_{\mathrm{SC}}$ ) is programmable from 15 to 45 mA . The following diagram demonstrates a typical application.

Figure 1. Typical Le77D11 VoSLIC ${ }^{\text {TM }}$ Device/Le78D11 VoSLAC ${ }^{\text {TM }}$ device Application in an 8-Port Integrated Access Device in Customer Premises

## BLOCK DESCRIPTIONS

Figure 2. Le77D11 VoSLIC ${ }^{\text {TM }}$ Device Block Diagram

## Two-Wire Interface

The two-wire interface block provides DC current and sends/receives voice signals to a telephone connected via the $\mathrm{A}_{\mathrm{i}}$ (Tip) and $B_{i}$ (Ring) pins. The $A_{i}$ (Tip) and $B_{i}$ (Ring) pins are also used to send the ringing signal to the telephone. The Le77D11 VoSLIC device can also be programmed in Disconnect state to place the A and B pins at high impedance with the Switching Regulator disabled.

## DC Feed

DC feed control in the Le78D11/Le77D11 chip set is implemented in the Le77D11 VoSLIC device. The current limit threshold ( $\mathrm{I}_{\text {LTH }}$ ) can be programmed via the MPI interface of the Le78D11 VoSLAC device. The current limit threshold ( $\mathrm{I}_{\text {LTH }}$ ) can be programmed up to 30 mA using the recommended $\mathrm{R}_{\mathrm{DC}}$ value.
Referring to Figure 3, the DC feed curve consists of two distinct regions. The first region is a flat anti-sat region that supplies a constant Tip-Ring voltage ( $\mathrm{V}_{\mathrm{AB}}$ open). The second region is a constant current region that begins when the loop current reaches the programmed current limit threshold ( $\mathrm{I}_{\mathrm{LTH}}$ ). This region looks like a constant current source with $3.2 \mathrm{k} \Omega$ shunt resistor. The short circuit current is nominally 14.4 mA greater than $\mathrm{I}_{\text {LTH }}$.
A block diagram of the DC feed control circuit is shown in Figure 4. In the anti-sat region, current source CS1 creates a constant reference current, which is limited to sub-voice frequencies by $\mathrm{C}_{\mathrm{LPFi}}$. This filtered current is then steered by the Polarity Control, depending on whether the VoSLIC device mode is Standby, Normal Active, or Reverse Polarity. The steered current then takes one of two paths to the Level Shift block, where it is used to set $V_{A}$ (TIP) and $V_{B}$ (RING). This voltage from the Level Shift block is buffered by the output amplifiers and appears at $A_{i}$ (TIP) and $B_{i}$ (RING).
When $\mathrm{I}_{\text {LOOP }} / 500$ becomes greater than $\mathrm{I}_{\text {LTH }} / 500$, the difference is subtracted from CS1, and again filtered by $\mathrm{C}_{\text {LPFi }}$. This reduced current causes a reduced DC feed voltage. In Standby and Normal Active, $A_{i}$ (TIP) is held constant, while $B_{i}($ RING ) is changed to reduce the feed voltage. In Reverse Polarity, $A_{i}(T I P)$ and $B_{i}(R I N G)$ are swapped. When $\left.\left(l_{\text {LOOP }}{ }^{-1} L_{\text {LTH }}\right) / 500=C S 1\right]$, all of the current from CS1 is subtracted, making the TIP-RING voltage $=0 \mathrm{~V}$. This is the short circuit condition. At least $100 \Omega$ loop and fuse resistance are required to ensure stability of the $A_{i}(T I P)$ and $B_{i}$ (RING) output amplifiers.

The capacitor $\mathrm{C}_{\mathrm{LPFF}}$, in conjunction with an internal $25-\mathrm{k} \Omega$ resistor (not shown) is used to create a low pass filter for the DC feed loop. This capacitor should nominally be $4.7 \mu \mathrm{~F}$, setting a 1.4 Hz pole. The purpose of this filter is to separate the operation of the DC feed from voice frequencies, preventing distortion and idle-channel noise.
Normal or Reverse Polarity is controlled by the Le78D11 VoSLAC device through the C3-1 state control pins. Some applications require slew rate control of the transition between these feed states. The capacitor, $\mathrm{C}_{\mathrm{NPRi}}$, may be used to increase the transition time and create a quiet polarity change. In the Normal Active state, the NPRFILT $_{i}$ pin is driven up to $\mathrm{V}_{\mathrm{CC}}$.
When Reverse Polarity is selected, $\mathrm{C}_{\mathrm{NPRi}}$ is discharged by current $\mathrm{I}_{\mathrm{NPR}}$, and the transition time is:

$$
\Delta \mathrm{t}=\frac{\left(\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{REF}}\right) \cdot \mathrm{C}_{\mathrm{NPRi}}}{\mathrm{I}_{\mathrm{NPR}}}
$$

In the Reverse Polarity state, the NPRFILT $T_{i}$ pin is discharged near ground. When Normal Active is selected, $\mathrm{C}_{\mathrm{NPRi}}$ is charged by current $I_{\text {NPR }}$, and the transition time is:

$$
\Delta t=\frac{V_{\mathrm{REF}} \cdot \mathrm{C}_{\mathrm{NPRi}}}{I_{\mathrm{NPR}}}
$$

A 100-nF capacitor provides a nominal Normal Active to Reverse Polarity transition time of about 5 ms and a Reverse Polarity to Normal Active transition time of 3 ms .

Figure 3. DC Feed Curve

$$
\begin{gathered}
\mathrm{I}_{\mathrm{SC}}=\mathrm{I}_{\mathrm{LTH}}+14.4 \mathrm{~mA} \\
\mathrm{I}_{\mathrm{LTH}}=\frac{\mathrm{V}_{\mathrm{DC}}}{\mathrm{R}_{\mathrm{DC}} \mathrm{~K}_{\mathrm{DC}}}=\frac{\mathrm{V}_{\mathrm{DC}}}{40}
\end{gathered}
$$

## Notes:

1. $\quad V_{D C}$ is programmable via the Le78D11 VoSLAC device. ( $V_{D C}=0.00 \mathrm{~V}$ to 1.20 V relative to $\left.V_{R E F}\right)$
2. $V_{R E F}=1.4 \mathrm{~V}$ nominal.
$\begin{array}{ll}\text { 3. } & K_{D C}=\text { Le77D11 VoSLIC device DC current gain. } \mathrm{K}_{\mathrm{DC}}=\frac{\mathrm{I}_{\mathrm{IMT}}}{\mathrm{I}_{\mathrm{LOOP}}} . \\ \text { 4. } & R_{D C}=\text { external resistor } 20 \mathrm{k} \Omega \text { nominal. }\end{array}$
3. $V_{A B}=V_{A i}-V_{B i}$ Tip-Ring differential voltage.
4. $I_{S C}=$ Loop short circuit current limit.
5. $I_{L T H}=$ LOOp current limit threshold. $I_{L T H}$ should be programmed to 15 mA or less when in the Standby state.
6. These are nominal values for DC feed curve. See the "Device Specifications" table for tolerance values.

Figure 4. DC Feed Block Diagram, Active and Standby Modes

## Note:

* denotes external components

## Ringing

Ringing is accomplished by placing the Le77D11 VoSLIC device into the Ringing state via the Le78D11 VoSLAC device's MPI interface. Placing the Le77D11 VoSLIC device into the ringing state automatically enables signal generator A in the Le78D11 VoSLAC device which puts the ringing signal on the receive signal path (pin VIN). (For information on programming the Le78D11 VoSLAC device's signal generators, please refer to the Le77D11/Le78D11 Chip Set User's Guide, document ID\# 080716). When the Le77D11 VoSLIC device is in the ringing state, the gain from the input pin, VIN, to the output is $\mathrm{K}_{\mathrm{R}}$, the ringing voltage gain. The output waveform is a quasi-balanced waveform, as shown in Figure 5 . On the positive half cycle of the input waveform, when $\left(V_{I N}-V_{R E F}\right)$ is positive, $V_{A B}$ is positive with $V_{A(T I P)}$ near $-4 V$ and $V_{B(R I N G)}$ brought negative. When $\left(V_{I N}-V_{R E F}\right)$ is negative, $V_{B(R I N G)}$ is held near $-4 V$ and $V_{A(T I P)}$ is brought more negative. The waveform can be either sinusoidal or trapezoidal under the control of the Le78D11 VoSLAC device.

To provide 90-V ringing capability, the application of a PNP bipolar switching transistor is used. For the reference schematic, Zetex part FZT955 in a SOT-223 package is used. Its $\mathrm{V}_{\text {CEO }}$ rating is 140 V . Due to the switching efficiency and overhead voltage, one can achieve 90 Vpk sinusoidal ringing with a 5 REN load with V ${ }_{S W}=12$ V. See Figure 6, Switching Power Supply Block Diagram, on page 7 for external filters recommended for a $90-\mathrm{V}$ peak ringing application.

Figure 5. Ringing Waveforms

A. Voltage Applied to VIN Pin

## B. Voltage Output at A (Tip) (dashed line) and B (Ring) (solid line) Pins

## Switcher Controller

The switcher controller's main function is to provide a negative power supply ( $\mathrm{V}_{\mathrm{REG}}$ ) that tracks Tip and Ring voltage for the twowire interface. As Tip and Ring voltage decreases, the switcher will likewise lower $V_{\text {REG }}$. In doing so, the switcher saves power because the device is not forced to maintain static supply voltage in all states.
The switching power supply controller uses a discontinuous mode buck-boost voltage converter topology. The frequency of operation is programmed by the Le78D11 VoSLAC device and is typically $85.3 \mathrm{kHz}(256 \mathrm{kHz} / 3)$. The Le78D11 VoSLAC device outputs a clock at its programmed frequency with approximately a $10 \%$ duty cycle which is fed into the CHCLK pin of the Le77D11 VoSLIC device. This clock signal controls the switching supply's operating frequency as well as the switching supply's maximum duty cycle. The Le77D11 VoSLIC device adjusts the actual duty cycle up to the maximum of $90 \%$ depending on the magnitude of the error voltage on the compensation (CHS) pin. The error signal is generated by integrating the difference in control current which is set by the Le77D11 VoSLIC device, and the feedback current. This error signal will converge to a value which in turn sets the duty cycle of the switching supply to satisfy feedback loop requirements.
A control current (See Figure 6, Switching Power Supply Block Diagram, on page 7) is generated on the Le77D11 VoSLIC device and is set to force $V_{\text {REG }}$ to track Tip and Ring line conditions to optimize system power efficiency. In equilibrium, the control current, which is fed into the CHS summing node, is set to provide the required line voltage plus an offset to give headroom for the power amplifiers.
The error signal on CHS is compared to an internal ramp signal. The ramp rate of this internal ramp signal is set by a resistor, $R_{\text {RAMP, }}$, to analog ground (AGND) on the FSET pin. A $1 \%$ resistor should be chosen to give the ramp precise control, and prevent internal nodes from going into saturation. $R_{\text {RAMP }}$ is determined by the equation: $R_{\text {RAMP }}=\left(24 \cdot 10^{9} \Omega-\mathrm{Hz}\right) /(\mathrm{CHCLK}$ Frequency $)$.
When the CHCLK signal goes from a logic high to a logic low, it will initiate a cycle by resetting the ramp, resetting a current limit latch, and turning on the external power switch. Then, on a cycle-by-cycle basis, one of three events will shut off the power switch depending on which event occurs first:
a) The ramp voltage exceeds the error voltage that is integrated on the CHS node (normal voltage feedback operation).
b) The CHCLK goes high ( $90 \%$ duty cycle point is reached).
c) The power switch current limit threshold is reached.

Cycle-by-cycle current limiting is provided by the current sense ILS pin which senses the external power switch current through the resistor $R_{\text {LIM }}$. If this pin exceeds -0.28 V with respect to $\mathrm{V}_{\text {SW }}$, the switching supply will set the current limit latch and shut off the external switch drive until the CHCLK pin goes high to reset the latch. This peak inductor current, and also peak switching converter power output can be controlled on a cycle-by-cycle basis and set by the equation $\mathrm{I}_{\mathrm{LIM}}=|0.28 \mathrm{~V}| / \mathrm{R}_{\mathrm{LIM}}$.
This sensing configuration has the added benefit that if the clock signal is removed for some reason, the power switch cannot be left on indefinitely.

A leading edge blanking filter is added at the output of the latch to ignore the first 150 ns of a current limit event. This feature is used to ignore a false current trip that may be caused by the power switch driving the reverse recovery charge $\left(Q_{R R}\right)$ of the external power rectifier.
This circuit has been optimized for operation to supply $20-\mathrm{Hz}$ ringing of $90-\mathrm{V}$ peak with a nominal supply voltage, $\mathrm{V}_{\mathrm{SW}}$, of 12 V .
The on chip driver is designed to drive an external PNP transistor. Its output drive is clamped between $7-9 \mathrm{~V}$ below $\mathrm{V}_{\mathrm{SW}}$, and can source or sink approximately 100 mA . The driver has approximately $50 \Omega$ of source resistance. When a PNP transistor is used, additional resistance should be added from the $\mathrm{SD}_{\mathrm{i}}$ pin to the base of the external power device.

For this application, $\mathrm{R}_{\mathrm{BD}}$ is $180 \Omega$ and capacitor $\mathrm{C}_{\mathrm{BD}}$ is 27 nF to increase the switching speed and efficiency. This increases the power available during the Ringing state when the converter operates at the highest currents. The capacitors $\mathrm{C}_{\mathrm{FL}}$ and $\mathrm{C}_{\mathrm{VREG}}$ use very low ESR film capacitors to minimize ripple and noise on $V_{\text {REG }}$. The capacitance is sized to permit more rapid charging of the capacitors, and hence a faster slew rate. Reduction of switcher noise is accomplished by using lower ESR capacitors and increasing the value of the $L_{V R E G}$ inductor in the post filter. The power supply output is able to track the ringing waveform under these conditions.

Figure 6. Switching Power Supply Block Diagram

## Note:

* denotes external components

## Signal Transmission

In Normal Active and Reverse Polarity states, the AC line current is sensed across the internal resistors, $\mathrm{R}_{\mathrm{S}}$ (see Figure 7, Transmission Block Diagram, on page 8), summed, attenuated and converted to voltage at the CFILT pin. This voltage then goes through a high pass filter (with a nominal 13 Hz corner frequency), implemented using an on-chip $8 \mathrm{k} \Omega$ nominal resistor and an external $C_{H P}$ capacitor, is amplified, and sent to the Le78D11 VoSLAC device at the VOUT pin. The output is proportional to the AC metallic component of the line voltage. Additionally, the signal transmission block receives the analog signal from the Le78D11 VoSLAC device. The analog signal is amplified and sent to the line.A proportion of the signal at $\mathrm{V}_{\text {OUT }}$ is also fed back to the line.

There are three parameters which define the AC characteristics of the Le77D11 VoSLIC device. First is the input impedance presented to the line or two-wire side $\left(Z_{2 W I N}\right)$, second is the gain from the four-wire $\left(V_{I N}\right)$ to the two-wire $\left(V_{A B}\right)$ side $\left(G_{42}\right)$, and third is the gain from the two-wire side to the four-wire $\left(\mathrm{V}_{\text {OUT }}\right)$ side $\left(\mathrm{G}_{24}\right)$.

## Input Impedance ( $\mathbf{Z}_{\mathbf{2 W I N}}$ )

$Z_{2 \text { WIN }}$ is the impedance presented to the line at the two-wire side, and is defined by:

$$
\mathrm{Z}_{2 \mathrm{WIN}}=2 \mathrm{R}_{\mathrm{F}}+\mathrm{K}_{\mathrm{V}} \mathrm{~K}_{\mathrm{OUT}} \mathrm{R}_{\mathrm{IMT}}
$$

where $2 \cdot R_{F}$ is the total resistance of the external fuse resistors in the circuit, $R_{I M T}$ is the impedance setting resistor, $K_{O U T}$ is the gain from $\mathrm{V}_{\text {OUT }}$ to $\mathrm{V}_{\mathrm{AB}}$, and $\mathrm{K}_{\mathrm{V}}$ is the voice current gain defined in the Transmission Specifications Table. Note that the equation reveals that $Z_{2 \text { WIN }}$ is a function of the selectable resistors, $R_{I M T}$ and $R_{F}$. For example, if $R_{F}=0 \Omega$ and $R_{I M T}$ is 100 k , the terminating impedance is $600 \Omega$. This is the configuration used in this data sheet for defining the device specifications. However, in a real application, $R_{F}=50 \Omega$ is recommended, producing a total input impedance of $700 \Omega$ which is a good starting point for meeting worldwide requirements using the programmable filters of the Le78D11 VoSLAC device.

## Two-Wire to Four-Wire Gain ( $\mathbf{G}_{\mathbf{2 4}}$ )

The two-wire to four-wire gain is the gain from the phone line to the VOUT output of the Le77D11 VoSLIC device. To solve for $\mathrm{G}_{24}$, the VIN pin is grounded (see Figure 7).

$$
\frac{\mathrm{V}_{\text {OUT }}}{\mathrm{V}_{\mathrm{AB}}}=\mathrm{G}_{24}=\frac{1}{\frac{2 \mathrm{R}_{\mathrm{F}}}{\mathrm{~K}_{\mathrm{V}} \mathrm{R}_{\text {IMT }}}+\mathrm{K}_{\mathrm{OUT}}}
$$

or

$$
G_{24}=-20 \log \left(K_{\text {OUT }}+\frac{2 R_{F}}{K_{V} R_{I M T}}\right) \text { in dB }
$$

Using the values of $R_{I M T}$ and $R_{F}$ from the application example, $G_{24}$ for this circuit is -10.9 dB .

## Four-Wire to Two-Wire Gain ( $\mathbf{G}_{\mathbf{4 2}}$ )

$G_{42}$ is the gain from the VIN input to the line. This gain is defined as $V_{A B} / V_{I N}$.

$$
\frac{V_{A B}}{V_{I N}}=G_{42}=\frac{K_{I N}\left(\frac{R_{L}}{R_{L}+2 R_{F}}\right)}{\left(1+\frac{K_{O U T} R_{I M T} K_{V}}{R_{L}+2 R_{F}}\right)}
$$

or

$$
G_{42}=-20 \log \left(\frac{K_{\text {IN }}\left(\frac{R_{L}}{R_{L}+2 R_{F}}\right)}{\left(1+\frac{K_{\text {OUT }} R_{\text {IMT }} K_{V}}{R_{L}+2 R_{F}}\right)}\right) \text { in dB }
$$

where $K_{I N}$ is the gain from VIN to $V_{A B}$. Using the values of $R_{I M T}$ and $R_{F}$ from the application example and $R_{L}=600 \Omega, G_{42}$ for this circuit is 7.3 dB .

## Note:

Equation derivations can be found in the Legerity Le77D11/Le78D11 Chip Set User's Guide (document ID\# 080716).
Figure 7. Transmission Block Diagram

## Note:

* denotes external components

## Fault Detection

Each channel of the Le77D11 Dual VoSLIC device has a fault detection pin, $\bar{F}_{1}$ or $\bar{F}_{2}$. These pins are driven low when a longitudinal current fault or foreign voltage fault occurs (see Figure 4, DC Feed Block Diagram, Active and Standby Modes, on page 5). When not in Disconnect state, there are three conditions that will cause the $\overline{\mathrm{F}}_{\mathrm{i}}$ pin to indicate a fault condition:

- $\quad\left|I_{A}-I_{B}\right|>I_{\text {LONG }}$
- In Normal Active and Standby state, a foreign voltage fault occurs in which $V_{A}$ is above ground or $V_{B}$ is close to $V_{R E G}$.
- In Reverse Polarity state, a foreign voltage fault occurs in which $V_{B}$ is above ground or $V_{A}$ is close to $V_{\text {REG }}$

In the Disconnect state, fault detection is not supported; however, fault conditions can be monitored by the Le78D11 device.
For more details on AC, DC fault detection, loss of power, or clock-failure alarm, please refer to the Legerity Le77D11/Le78D11 Chip Set User's Guide (document ID\# 080716).

## Signal Conditioning

The RDC ${ }_{i}$ pin is used to set the DC feed current limit, as described in the DC feed section.
The $\mathrm{IMT}_{\mathrm{i}}$ pin provides $\mathrm{K}_{\mathrm{DC}}$ times the loop current to the Le78D11 VoSLAC device. The Le78D11 VoSLAC device implements all loop supervision and ring trip processing on this signal.

$$
\mathrm{I}_{\mathrm{IMT}}=\frac{\mathrm{I}_{\mathrm{A}}+\mathrm{I}_{\mathrm{B}}}{2} \cdot \mathrm{~K}_{\mathrm{DC}}
$$

## Thermal Overload

When the die temperature around the power amplifier of an Le77D11 Dual VoSLIC device channel reaches approximately $160^{\circ} \mathrm{C}$, the IMT pin of that channel is pulled High. At the same time, all the blocks controlling that channel of the device are shut off, except for the logic interface block. The VoSLIC channel goes into a state similar to Disconnect, making the line current zero. When the temperature drops below $145^{\circ} \mathrm{C}$, the VoSLIC channel returns to its previous state. It is important to recognize that even while a channel experiences thermal overload, the state of the device can be modified. At TSD, the switcher is turned off.

## Control Logic

Each channel of the Le77D11 VoSLIC device has three input pins from the Le78D11 VoSLAC device (C3, C2, and C1). The inputs set the operational state of each channel. There are six operational VoSLIC device states (See Table 1): Low Power Standby, Disconnect, Normal Active, Reverse Polarity, Ringing and Line Test. This leaves two reserved logic states.

Table 1. Device Operating States

| C3 | C2 | C1 | Operating Mode | Description |
| :---: | :---: | :---: | :--- | :--- |
| 0 | 0 | 0 | Low Power Standby | Voice transmission disabled. Maximum loop current capability and loop <br> current sensing range are reduced. |
| 0 | 0 | 1 | Disconnect | Le77D11 Dual VoSLIC device channel is shut down and switching power <br> supply is shut off.* |
| 0 | 1 | 0 | Normal Active | Le77D11 Dual VoSLIC device channel fully operational. $A_{i}(T I P)$ is more <br> positive than $B_{i}(R I N G) . ~ A l s o ~ u s e d ~ f o r ~ o n-h o o k ~ t r a n s m i s s i o n . ~$ |
| 0 | 1 | 1 | Reverse Polarity | Similar to normal active, but DC polarity is reversed so that the $\mathrm{B}_{\mathrm{i}}(\mathrm{RING})$ <br> lead is more positive than the $\mathrm{A}_{\mathrm{i}}(T I P)$ lead. Also used for on-hook <br> transmission. |
| 1 | 0 | 0 | Ringing | Ringing state with $\mathrm{V}_{\text {AB }}$ set to $\mathrm{K}_{R} \cdot \mathrm{~V}_{\text {IN }}$. The switching supply maintains <br> minimum headroom for the sourcing and sinking amplifiers in order to <br> maximize power efficiency. |
| 1 | 0 | 1 | Line Test State | Similar to ringing state with reduced bias currents for lower noise. Loop <br> current sensing range is limited. See IMT pin specifications. |
| 1 | 1 | 0 | Reserved | Not used. |
| 1 | 1 | 1 | Reserved | Not used. |

## Note:

* When in Disconnect state, the DC-DC converter is disabled and the $V_{R E G}$ voltage will decay to $0 V$. The $A_{i}$ and $B_{j}$ outputs are disabled; however, they still have ESD protection diodes to BGND and VREG which will provide a low impedance clamp to any line voltages > $\pm 0.5 \mathrm{~V}$.
*When transitioning from any state to Disconnect, the Le77D11 device momentarily passes through Reverse Polarity, pulling the A-lead towards Vreg. During line testing, when the SLIC device is placed in the Disconnect state, wait >3 seconds before proceeding with line measurements.

## CONNECTION DIAGRAM

## Note:

1. Pin 1 is marked for orientation.

## PIN DESCRIPTIONS

| Pin Name | Type | Description |
| :---: | :---: | :---: |
| AGND | Ground | Analog and digital ground return for VCC circuitry (common to both channels). |
| $\mathrm{A}_{1,2}$ (Tip) | Output | A (Tip) lead power amplifier outputs for channels 1 and 2. |
| $\mathrm{BGND}_{1,2}$ | Ground | Supply ground return for power amplifiers on channel 1 and 2. |
| $\mathrm{B}_{1,2}$ (Ring) | Output | B (Ring) lead power amplifier outputs for channels 1 and 2. |
| $\mathrm{C} 1_{1}, \mathrm{C} 2_{1}, \mathrm{C} 3_{1}$ | Input | Logic control inputs to control channel 1 state. |
| $\mathrm{C} 1_{2}, \mathrm{C} 2_{2}, \mathrm{C} 3_{2}$ | Input | Logic control inputs to control channel 2 state. |
| CFILT $_{1,2}$ | Output | AC coupling pins for 4-wire (VOUT) amplifiers of channels 1 and 2. |
| CHCLK | Input | Switching power supply clock input that sets the frequency and maximum duty cycle of the switcher (common to both channels). |
| $\mathrm{CHS}_{1,2}$ | Input | Compensation nodes for switching power supply channels 1 and 2. |
| $\bar{F}_{1,2}$ | Output | Fault detect pins for channels 1 and 2. A low indicates a fault for the respective channel, which can be triggered by large longitudinal current, or ground key. |
| FSET | Input | Ramp rate control pin for 85.3 kHz operation. |
| $\mathrm{IMT}_{1,2}$ | Output | Current output equal to the loop current divided by 500. During thermal overload, IMT is forced High. |
| $\mathrm{ILS} \mathrm{S}_{1,2}$ | Input | Voltage sense pins to limit peak current in external switching power supply transistors (channels 1 and 2). |
| $\mathrm{LPF}_{1,2}$ | Output | A capacitor tied from these pins to AGND stabilizes the DC feed loop, and lowers Idle Channel Noise for channels 1 and 2. |
| NPRFILT $_{1,2}$ | Output | An optional capacitor tied from these pins to AGND controls the reverse polarity slew rate of channels 1 and 2. |
| $\mathrm{RDC}_{1,2}$ | Input | Resistor connection to programmable VDC ${ }_{\mathrm{i}}$ pin of Le78D11 VoSLAC device to set DC feed current limit threshold (ILTH) of each channel. |
| $\mathrm{SD}_{1,2}$ | Output | Base (gate) drive for switching power supply transistor (channels 1 and 2). |
| VCC | Supply | A nominal 3.3 V power supply for internal VCC circuitry (common to both channels). |
| $\mathrm{VHP}_{1,2}$ | Output | High pass inverting summing nodes of the VOUT amplifiers driven by the AC current coming from $\mathrm{CFILT}_{1}$ and $\mathrm{CFILT}_{2}$. |
| VOUT $_{1,2}$ | Output | Analog (4-wire side) VOUT amplifier output. |
| $\mathrm{VIN}_{1,2}$ | Input | Analog (4-wire side) voice or ringing signal inputs. These pins multiplex between 4-wire voice input and ringing input depending on the programmed state of the Le77D11 VoSLIC device channel. |
| VREF | Supply | A nominal 1.4 V reference supplied by the Le78D11 VoSLAC device for internal use (common to both channels). |
| $\mathrm{VREG}_{1,2}$ | Supply | Negative regulated power supplies generated by the Le77D11 VoSLIC device Switching Regulators. (Channels 1 and 2). |
| VSW | Supply | A positive supply used to generate the negative supplies of $\mathrm{V}_{\text {REG1 }}$, $V_{\text {REG2 }}$ (common to both channels). |
| Exposed Pad | Isolated | Exposed pad on underside of device must be connected to a heat spreading area. The AGND plane is recommended. |

## ABSOLUTE MAXIMUM RATINGS

Stresses above those listed under Absolute Maximum Ratings can cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maximum ratings for extended periods can affect device reliability.

| Storage temperature | -55 to $+150^{\circ} \mathrm{C}$ |
| :---: | :---: |
| Ambient temperature, under bias | $-40^{\circ}$ to $85^{\circ} \mathrm{C}$ |
| $\mathrm{V}_{\mathrm{CC}}$ with respect to AGND | -0.4 to +6.5 V |
| $\mathrm{V}_{\text {REG }}$ with respect to BGND | +0.4 to -115 V |
| BGND with respect to AGND | -100 to 100 mV |
| $\begin{aligned} & \text { A (Tip) or B (Ring) to BGND: } \\ & \quad \text { Continuous } \\ & 10 \mathrm{~ms}(\mathrm{~F}=0.1 \mathrm{~Hz}) \\ & 1 \mu \mathrm{~s}(\mathrm{~F}=0.1 \mathrm{~Hz}) \\ & 250 \mathrm{~ns}(\mathrm{~F}=0.1 \mathrm{~Hz}) \end{aligned}$ | $\mathrm{V}_{\text {REG }}-1$ to $\mathrm{BGND}+1$ <br> $V_{\text {REG }}-5$ to BGND +5 <br> $V_{\text {REG }}-10$ to $B G N D+10$ <br> $\mathrm{V}_{\text {REG }}-15$ to BGND +15 |
| Current from A (Tip) or B (Ring) | $\pm 150 \mathrm{~mA}$ |
| C1, C2, C3 to AGND | -0.4 to VCC + 0.4 V |
| CHCLK | AGND to VCC |
| $V_{\text {SW }}$ | BGND to +44 V |
| $V_{\text {REF }}$ | AGND to VCC |
| Maximum power dissipation, $\mathrm{T}_{\mathrm{A}}=85^{\circ} \mathrm{C}$ (See notes) | 1.8 W |
| Thermal Data: In 44-pin eTQFP package | $\begin{aligned} & \hline \theta_{\mathrm{JA}} \\ & 32^{\circ} \mathrm{C} / \mathrm{W} \end{aligned}$ |
| Thermal Data: In 44-pin eTQFP package | $\begin{aligned} & \hline \theta_{\mathrm{JC}} \\ & 9.2^{\circ} \mathrm{C} / \mathrm{W} \end{aligned}$ |
| ESD Immunity (Human Body Model) | JESD22 Class 1C compliant |

## Notes:

Thermal limiting circuitry on chip will shut down the circuit at a junction temperature of about $165^{\circ} \mathrm{C}$. Continuous operation above $145^{\circ} \mathrm{C}$ junction temperature may degrade device reliability.
The thermal performance of a thermally enhanced package is assured through optimized printed circuit board layout. Specified performance requires that the exposed thermal pad be soldered to an equally sized exposed copper surface, which, in turn, conducts heat through 160.3 mm diameter vias on a 1.27 mm pitch to a large (>500 mm ${ }^{2}$ ) internal copper plane. (Refer to Legerity application note Layout Considerations for the Le77D112 and Le9502 Devices, document ID\# 081013).

## Package Assembly

The green package devices are assembled with enhanced environmental compatible lead ( Pb ), halogen, and antimony-free materials. The leads possess a matte-tin plating which is compatible with conventional board assembly processes or newer leadfree board assembly processes. The peak soldering temperature should not exceed $245^{\circ} \mathrm{C}$ during printed circuit board assembly.
The standard (non-green) package devices are assembled with industry-standard mold compounds, and the leads possess a tin/ lead $(\mathrm{Sn} / \mathrm{Pb})$ plating. These packages are compatible with conventional SnPb eutectic solder board assembly processes. The peak soldering temperature should not exceed $225^{\circ} \mathrm{C}$ during printed circuit board assembly.
Refer to IPC/JEDEC J-Std-020B Table 5-2 for the recommended solder reflow temperature profile.

## OPERATING RANGES

Legerity guarantees the performance of this device over commercial $\left(0^{\circ}\right.$ to $\left.70^{\circ} \mathrm{C}\right)$ and industrial $\left(-40^{\circ}\right.$ to $\left.85^{\circ} \mathrm{C}\right)$ temperature ranges by conducting electrical characterization over each range, and by conducting a production test with single insertion coupled to periodic sampling. These characterization and test procedures comply with section 4.6.2 of Bellcore GR-357-CORE Component Reliability Assurance Requirements for Telecommunications Equipment.

## Environmental Ranges

| Ambient Temperature | $-40^{\circ}$ to $85^{\circ} \mathrm{C}$ |
| :---: | :---: |

## Electrical Ranges

| $\mathrm{V}_{\mathrm{CC}}$ | $3.3 \mathrm{~V} \pm 5 \%$ |
| :--- | :--- |
| $\mathrm{~V}_{\text {SW }}$ | 8 to 40 V |
| $\mathrm{~V}_{\text {REF }}$ | $1.40 \mathrm{~V} \pm 50 \mathrm{mV}$ |
| $\mathrm{V}_{\text {REG }}$ | -7 to -110 V ( 0 V in Disconnect state $)$ |

Unless otherwise noted, test conditions are: $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{SW}}=12.0 \mathrm{~V}, \mathrm{~V}_{\mathrm{REF}}=1.4 \mathrm{~V}$. For Active, Reverse Polarity, Line Test and Disconnect, $\mathrm{V}_{\mathrm{DC}}=0.6 \mathrm{~V}\left(\mathrm{l}_{\mathrm{LTH}}=15 \mathrm{~mA}\right)$; for Standby, $\mathrm{V}_{\mathrm{DC}}=0.4 \mathrm{~V}\left(\mathrm{I}_{\mathrm{LTH}}=10 \mathrm{~mA}\right)$. AGND = BGND, there are no fuse resistors, $\mathrm{R}_{\mathrm{L}}=600 \Omega,-40^{\circ} \mathrm{C}<\mathrm{T}_{\mathrm{A}}<85^{\circ} \mathrm{C}, 85.3 \mathrm{kHz} \mathrm{CHCLK}$. Ringing configuration is $\mathrm{V}_{\mathrm{IN}}=0.7 \mathrm{Vpk}$ $20-\mathrm{Hz}$ sinusoidal. Line Test configuration is $\mathrm{V}_{\mathrm{IN}}=0.5 \mathrm{Vdc}$. Please refer to the test circuit on page 18 for all other component values. Supply Currents and Power Dissipation

| Operation States | Condition | 3.3 V VCC Supply Current (mA) |  |  | VREG Supply Current (mA) (Note 4) |  |  | VREG Supply Power (mW) |  |  | SLIC Device Power (mW) (Note 5) |  |  | VSW Pin Current (mA) | Note |

Notes:

1. Values shown are for one channel only but are tested with both channels in the same state.
2. Not tested in production. Parameter is guaranteed by characterization or correlation to other tests.
3. Not tested in production. Parameter is guaranteed by characterization or correlation to other tests.
4. Production test forces Vin $=0.5$ Vdc which is equivalent to Vin $=0.7$ Vac.
5. $\quad \mathrm{I}_{\mathrm{VSW}}=\frac{\mathrm{V}_{\mathrm{REG}} \bullet \mathrm{I}_{\mathrm{VREG}}}{\eta \bullet \mathrm{V}_{\mathrm{SW}}}$, where $\eta=$ efficiency. For our recommended circuit, an efficiency of 0.6 can be assumed under heavy loads.

## SPECIFICATIONS

## System Specifications

The performance targets defined in this section are for a system using the Le78D11/Le77D11 chip set. Specifications for the Le78D11 VoSLAC device are published separately.

| Item | Condition | Min | Typ | Max | Unit | Note |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Output Impedance during internal ringing | Ringing mode, Le78D11 VoSLAC device generating internal ringing |  | 2•RF |  | $\Omega$ | 4. |
| Sinusoidal Ringing THD | Ringing mode, $R_{L}=1500 \Omega$ generating internal sinusoidal ringing |  | 2 |  | \% | 4. |
| Signaling Performance Limits |  |  |  |  |  |  |
| Hook switch threshold | $\mathrm{ITH}=10 \mathrm{~mA}$ | 7 |  | 13 | mA | 4. |
| Hook switch hysteresis | All ITH settings |  | 10 |  | \% | 3. |
| Internal Ring-trip Accuracy | RTSL = 2.2 W (07h) | -20 |  | +20 | \% | 4. |

## Device Specifications

| Specification | Condition | Min | Typ | Max | Unit | Note |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Notes:

1. $\quad V_{A B}=$ Voltage between the $A_{i}$ (Tip) and $B_{i}$ (Ring) pins.
2. Overload level is defined when $T H D=1 \%$.
3. Guaranteed by design.
4. Not tested in production. Parameter is guaranteed by characterization or correlation to other tests.
5. Layout should have less than 10 pF from pin to ground.
6. $I_{I M T}=$ current coming out from IMT pin.
7. When On Hook, $R_{L D C}$ is open circuit, $R_{L A C}=600 \Omega$.
8. C3 and C2 have pull-downs and C1 has pull-up to set the device state to Disconnect when the pins are floating.
Note:

* denotes pins that are common to both channels. $i=$ per channel component.

* Denotes pins that are common to both channels.
i per channel component.
Protection is voltage tracking device.
$C_{E S R i}$ is located close to gate on U3.

## APPLICATION CIRCUIT PARTS LIST

The following list defines the parts and part values required to meet target specification limits for 90 Vpk ringing with $\mathrm{V}_{\mathrm{SW}}=12 \mathrm{~V}$ and CHCLK $=85.3 \mathrm{kHz}$ for channel i of the line card $(\mathrm{i}=1,2)$. The protection circuit is not included.

| Item | Quantity <br> (see note 1) | Type | Value | Tol. | Rating |  |
| :--- | :---: | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{C}_{\mathrm{HSi}}$ | 2 | Capacitor | 1 nF | $10 \%$ | 50 V | Panasonic / ECJ-1VB1H102K, 0603 |
| $\mathrm{C}_{\mathrm{BDi}}$ | 2 | Capacitor | 27 nF | $10 \%$ | 16 V | Kemet C0603C273K5RAC |
| $\mathrm{C}_{1}, \mathrm{C}_{2}, \mathrm{C}_{3}$, <br> $\mathrm{C}_{4}$ | 4 | Capacitor | 100 nF | $10 \%$ | 16 V | Panasonic / ECJ-1VF1C104Z, 0603 |
| $\mathrm{C}_{\mathrm{ESRi}}$ | 2 | Capacitor | 0.1 uF | $10 \%$ | 200 V | CaIChip GMC31X7R104K200NT |
| $\mathrm{C}_{\mathrm{NPRi}}$ | 2 | Capacitor | 100 nF | $10 \%$ | 16 V | Panasonic / ECJ-1VB1C104K (optional) |

## Note:

1. Quantities required for a complete two-channel solution.

## Notes:

1. Controlling dimension in millimeter unless otherwise specified.
2. Dimensions "D1" and "E1" do not include mold protrusion. Allowable protrusion is 0.25 mm per side.
"D1" and "E1" are maximum plastic body size dimensions including mold mismatch.
3. Dimension "b" does not include Dambar protrusion. Allowable Dambar protrusion shall not cause the lead width to exceed the maximum " $b$ " dimension by more than 0.08 mm .
4. Dambar can not be located on the lower radius or the foot. Minimum space between protrusion and an adjacent lead is 0.07 mm for 0.4 mm and 0.5 mm pitch packages.
5. Square dotted line is E-Pad outline.
6. " $N$ " is the total number of terminals.

## 44-Pin eTQFP

## Note:

Packages may have mold tooling markings on the surface. These markings have no impact on the form, fit or function of the device. Markings will vary with the mold tool used in manufacturing.

## REVISION HISTORY

## Revision B1 to C1

- In Pin Descriptions, FSET pin, removed reference to 256 kHz operation
- In Absolute Maximum Ratings, the following changes were made:
- Changed $\mathrm{T}_{\mathrm{A}}$ from $22.7^{\circ}$ to $32^{\circ} \mathrm{C} / \mathrm{W}$
- Changed maximum power dissipation from 2.6 to 1.8 W
- Added another note describing eTQFP package
- In Supply Currents and Power Dissipation, Ringing operation state, removed condition $\mathrm{V}_{\text {IN }}=0.7 \mathrm{~V}_{\mathrm{DC}}$
- In System Specifications, first paragraph, removed $T_{A}=0$ to $70^{\circ} \mathrm{C}$
- Updated Physical Dimensions drawing

## Revision C1 to D1

- Made updates pertaining to 90 Vpk throughout document

## Revision D1 to E1

- In Device Specifications, $\mathrm{I}_{\mathrm{LSi}}$ Offset, changed min. from .27 to .25 and max from .29 to .31
- Made updates to Application Circuit Parts List, including:
- Increased voltage ratings on capacitors $\mathrm{C}_{\mathrm{ESRi}}, \mathrm{C}_{\text {VREGi }}, \mathrm{C}_{\mathrm{FLi}}$ and $\mathrm{C}_{\text {VREG1 }}$
- Changed value of $\mathrm{C}_{\mathrm{FLi}}$ and $\mathrm{C}_{\mathrm{VREG} 1}$ to $1 \mu \mathrm{~F}$

## Revision E1 to F1

- Modified application circuit and BOM to reflect addition of the TISP61089BDR protector

## Revision F1 to G1

- Added green package OPN to Ordering Information, on page 1
- Added Package Assembly, on page 12
- Updated DC specifications to Vreg, Isc, IMTi and Metering Gain based on Errata notice April 292004 revision A1 for device version JCBB.
- Included operational issues 3.0 from errata notice April 29, 2004.

## Revision G1 to G2

- Enhanced format of package drawing in Physical Dimensions, on page 21
- Added new headers/footers due to Zarlink purchase of Legerity on August 3, 2007

Information relating to products and services furnished herein by Zarlink Semiconductor Inc. trading as Zarlink Semiconductor or its subsidiaries (collectively "Zarlink") is believed to be reliable. However, Zarlink assumes no liability for errors that may appear in this publication, or for liability otherwise arising from the application or use of any such information, product or service or for any infringement of patents or other intellectual property rights owned by third parties which may result from such application or use. Neither the supply of such information or purchase of product or service conveys any license, either express or implied, under patents or other intellectual property rights owned by Zarlink or licensed from third parties by Zarlink, whatsoever. Purchasers of products are also hereby notified that the use of product in certain ways or in combination with Zarlink, or non-Zarlink furnished goods or services may infringe patents or other intellectual property rights owned by Zarlink.

#### Abstract

This publication is issued to provide information only and (unless agreed by Zarlink in writing) may not be used, applied or reproduced for any purpose nor form part of any order or contract nor to be regarded as a representation relating to the products or services concerned. The products, their specifications, services and other information appearing in this publication are subject to change by Zarlink without notice. No warranty or guarantee express or implied is made regarding the capability, performance or suitability of any product or service. Information concerning possible methods of use is provided as a guide only and does not constitute any guarantee that such methods of use will be satisfactory in a specific piece of equipment. It is the user's responsibility to fully determine the performance and suitability of any equipment using such information and to ensure that any publication or data used is up to date and has not been superseded. Manufacturing does not necessarily include testing of all functions or parameters. These products are not suitable for use in any medical products whose failure to perform may result in significant injury or death to the user. All products and materials are sold and services provided subject to Zarlink's conditions of sale which are available on request.

Purchase of Zarlink's $I^{2} \mathrm{C}$ components conveys a licence under the Philips $I^{2} \mathrm{C}$ Patent rights to use these components in an $I^{2} \mathrm{C}$ System, provided that the system conforms to the $I^{2} \mathrm{C}$ Standard Specification as defined by Philips.
