16-BIT SERIAL TO PARALLEL CONVERTER

■ GENERAL DESCRIPTION

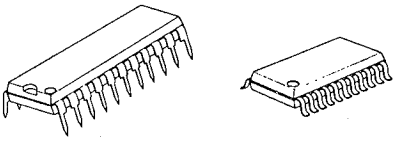
The NJU3715 is a 16-bit serial to parallel converter especially apply to MPU outport expander.

The effective outport assignment of MPU is available as the connection between NJU3715 and MPU is required only 4 lines.

Up to 5MHz signal can be input to the serial data input terminal and the data is output from parallel output buffer through serial in parallel out shift register and parallel data latches.

The hysteresis input circuit realized wide noise margin and high driverbility output buffer (25mA) can drive LED directly.

■ PACKAGE OUTLINE



NJU3715L NJU3715G

■ FEATURES

- 16-Bit Serial In Parallel Out
- Hysteresis Input ---- 0.5V typ
- Operating Voltage ---- 5V±10%
- Operating Frequency ---- 5MHz or more
- Output Current ---- 25mA
- C-MOS Technology
- Package Outline ---- SDIP/SOP 22

■ FUNCTIONAL DESCRIPTION

(1) **Reset**

When the "L" level is input to the $\overline{CLR}$ terminal, all latches are reset and all parallel conversion output are "L" level.

Normally, the $\overline{CLR}$ terminal should be "H" level.

(2) **Data Transmission**

In the $\overline{STB}$ terminal is "H" level and input the clock signal to the CLK terminal, the serial data input from DATA terminal shift in the shift register by synclonizing at rising edge of the clock signal.

When the $\overline{STB}$ terminal change to "L" level, the data in the shift register transfer to the latch.

Even if the $\overline{STB}$ terminal is "L" level, the input clock signal shift the data in the shift register, therefore, the clock signal control is needed.

Furthermore, the 4 input circuits have a hysteresis characteristics by using the schmitt trigger structure to protect the noise.

CLK	$\overline{STB}$	$\overline{CLR}$	OPERATION
X	X	L	All latch are reset (the data in the shift register is no change). All of Parallel convert output are "L".
⎍	H	H	The serial data input from DATA terminal input to the shift register. In this stage, the data in the latch is no change.
L	L	H	The data in the shift register transfer to the latch. And the data in the latch output from parallel output.
H			
⎍			The CLK input in the $\overline{STB}$="L" and $\overline{CLR}$="H" state, the data shift in the shift register and latched data also change in accordance with the shift register.
