

MC10216

High Speed Triple Line Receiver

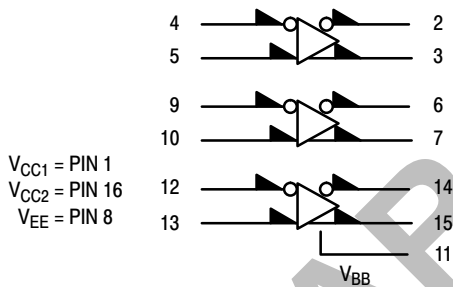

The MC10216 is a high speed triple differential amplifier designed for use in sensing differential signals over long lines. The base bias supply (V_{BB}) is made available at pin 11 to make the device useful as a Schmitt trigger, or in other applications where a stable reference voltage is necessary.

Active current sources provide the MC10216 with excellent common mode noise rejection. If any amplifier in a package is not used, one input of that amplifier must be connected to V_{BB} (pin 11) to prevent upsetting the current source bias network.

Complementary outputs are provided to allow driving twisted pair lines, to enable cascading of several amplifiers in a chain, or simply to provide complement outputs of the input logic function.

- $P_D = 100 \text{ mW typ/pkg (No Load)}$
- $t_{pd} = 1.8 \text{ ns typ (Single ended)}$
- $t_{pd} = 1.5 \text{ ns typ (Differential)}$
- $t_r, t_f = 1.5 \text{ ns typ (20\%–80\%)}$

LOGIC DIAGRAM

* V_{BB} to be used to supply bias to the MC10216 only and bypassed (when used) with $0.01 \mu\text{F}$ to $0.1 \mu\text{F}$ capacitor. When the input pin with bubble goes positive, its respective output pin with bubble goes positive.

DIP PIN ASSIGNMENT

Pin assignment is for Dual-in-Line Package.

For PLCC pin assignment, see the Pin Conversion Tables on page 18 of the ON Semiconductor MECL Data Book (DL122/D).

Each MECL 10,000 series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50-ohm resistor to -2.0 volts. Test procedures are shown for only one gate. The other gates are tested in the same manner.
