

## DS10CP154A 1.5 Gbps 4x4 LVDS Crosspoint Switch

## **General Description**

The DS10CP154A is a 1.5 Gbps 4x4 LVDS crosspoint switch optimized for high-speed signal routing and switching over FR-4 printed circuit board backplanes and balanced cables. Fully differential signal paths ensure exceptional signal integrity and noise immunity. The non-blocking architecture allows connections of any input to any output or outputs. The switch configuration can be accomplished via external pins or the System Management Bus (SMBus) interface. In addition, the SMBus circuitry enables the loss of signal (LOS) monitors that can inform a system of the presence of an open inputs condition (e.g. disconnected cable).

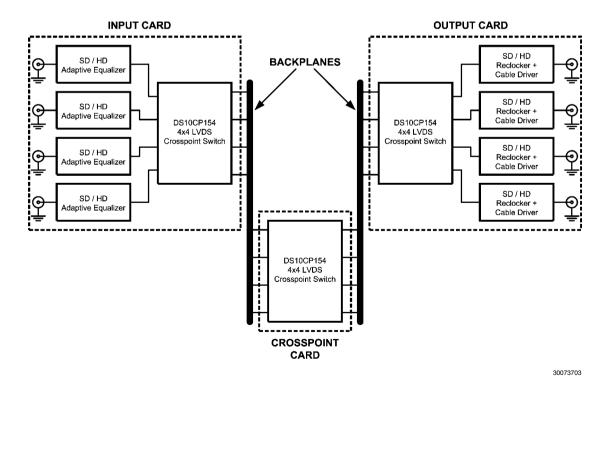

Wide input common mode range allows the switch to accept signals with LVDS, CML and LVPECL levels; the output levels are LVDS. A very small package footprint requires a minimal space on the board while the flow-through pinout allows easy board layout. Each differential input and output is internally terminated with a  $100\Omega$  resistor to lower return losses, reduce component count and further minimize board space.

### Features

- DC 1.5 Gbps low jitter, low skew, low power operation
- Pin and SMBus configurable, fully differential, nonblocking architecture
- Wide input common mode range enables DC coupled interface to CML or LVPECL drivers
- LOS circuitry detects open inputs fault condition
- On-chip 100 Ω input and output termination minimizes insertion and return losses, reduces component count and minimizes board space
- 8 kV ESD on LVDS I/O pins protects adjoining components
- Small 6 mm x 6 mm LLP-40 space saving package

## Applications

- High-speed channel select applications
- Clock and data buffering and muxing
- SD / HD SDI Routers

## **Pin Descriptions**

| Pin Name  | Pin<br>Number                           | I/O, Туре   | Pin Description  |
|---|---|-------------|--|
| IN0+, IN0- ,<br>IN1+, IN1-,<br>IN2+, IN2-,<br>IN3+, IN3-        | 1, 2,<br>4, 5,<br>6, 7,<br>9, 10        | I, LVDS     | Inverting and non-inverting high speed LVDS input pins.  |
| OUT0+, OUT0-,<br>OUT1+, OUT1-,<br>OUT2+, OUT2-,<br>OUT3+, OUT3- | 29, 28,<br>27, 26,<br>24, 23,<br>22, 21 | O, LVDS     | Inverting and non-inverting high speed LVDS output pins.   |
| EN_smb  | 17                                      | I, LVCMOS   | System Management Bus (SMBus) mode enable pin. The pin has<br>an internal 20k pull down. When the pin is set to a [1], the device<br>is in the SMBus mode. All SMBus registers are reset when the pin<br>is toggled.   |
| S00/SCL,<br>S01/SDA   | 37,<br>36                               | I/O, LVCMOS | For EN_smb = [0], these pins select which LVDS input is routed<br>to the OUT0.<br>In the SMBus mode, when the EN_smb = [1], these pins are the<br>SMBus clock input and data I/O pins respectively.  |
| S10/ADDR0,<br>S11/ADDR1   | 35,<br>34                               | I/O, LVCMOS | For EN_smb = [0], these pins select which LVDS input is routed<br>to the OUT1.<br>In the SMBus mode, when the EN_smb = [1], these pins are the<br>User-Set SMBus Slave Address inputs.   |
| S20/ADDR2,<br>S21/ADDR3   | 33,<br>32                               | I/O, LVCMOS | For EN_smb = [0], these pins select which LVDS input is routed<br>to the OUT2.<br>In the SMBus mode, when the EN_smb = [1], these pins are the<br>User-Set SMBus Slave Address inputs.   |
| S30, S31  | 13, 14                                  | I, LVCMOS   | For EN_smb = [0], these pins select which LVDS input is routed<br>to the OUT3.<br>In the SMBus mode, when the EN_smb = [1], these pins are non-<br>functional and should be tied to either logic [0] or [1].   |
| PWDN  | 38                                      | I, LVCMOS   | For EN_smb = [0], this is the power down pin. When the $\overline{PWDN}$ is<br>set to a [0], the device is in the power down mode. The SMBus<br>circuitry can still be accessed provided the EN_smb pin is set to a<br>[1].<br>In the SMBus mode, the device is powered up by either setting the<br>$\overline{PWDN}$ pin to [1] <b>OR</b> by writing a [1] to the Control Register D[7]<br>bit ( $\overline{SoftPWDN}$ ). The device will be powered down by setting the<br>$\overline{PWDN}$ pin to [0] <b>AND</b> by writing a [0] to the Control Register D[7]<br>bit ( $\overline{SoftPWDN}$ ). |
| NC  | 11, 12,<br>18, 19,<br>20, 31,<br>39, 40 |             | No connect pins. May be left floating.   |
| VDD   | 3, 8,<br>15,25, 30                      | Power       | Power supply pins.   |
| GND   | 16, DAP                                 | Power       | Ground pin and pad (DAP - die attach pad).   |

## Absolute Maximum Ratings (Note 4)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/ Distributors for availability and specifications.

Note 4: "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions.

Note 5: The Electrical Characteristics tables list guaranteed specifications under the listed Recommended Operating Conditions except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes. Typical specifications are estimations only and are not guaranteed.

Note 6: Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground except  $V_{OD}$  and  $\Delta V_{OD}$ .

Note 7: Typical values represent most likely parametric norms for  $V_{CC} = +3.3V$  and  $T_A = +25^{\circ}C$ , and at the Recommended Operation Conditions at the time of product characterization and are not guaranteed.

Note 8: Output short circuit current ( $I_{OS}$ ) is specified as magnitude only, minus sign indicates direction only.

Note 9: The Electrical Characteristics tables list guaranteed specifications under the listed Recommended Operating Conditions except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes. Typical specifications are estimations only and are not guaranteed.

Note 10: Typical values represent most likely parametric norms for  $V_{CC} = +3.3V$  and  $T_A = +25^{\circ}C$ , and at the Recommended Operation Conditions at the time of product characterization and are not guaranteed.

Note 11: Specification is guaranteed by characterization and is not tested in production.

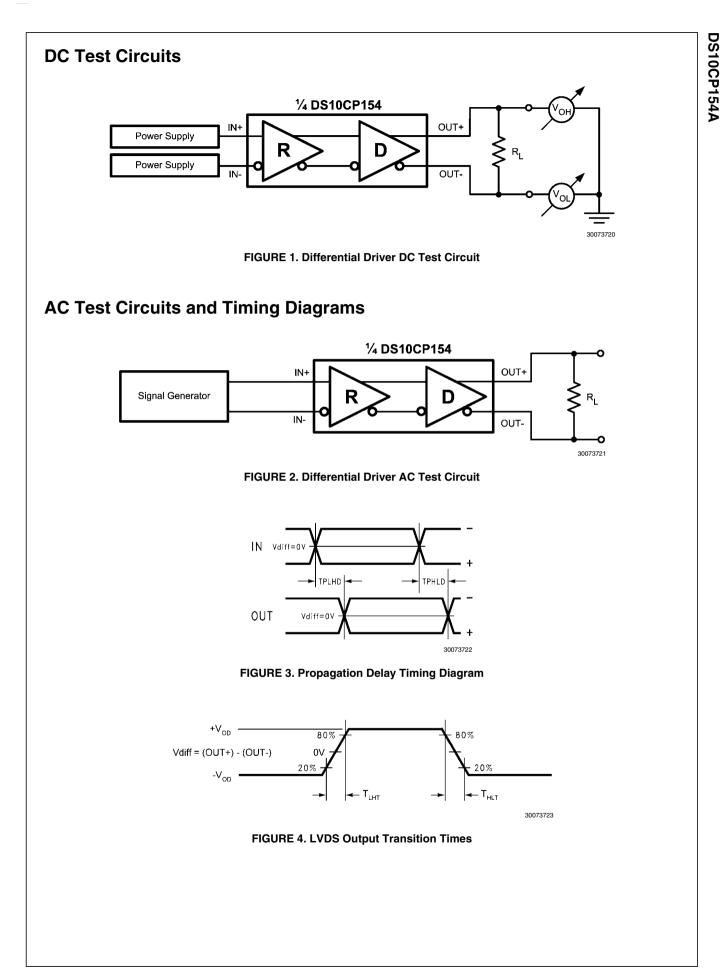

Note 12:  $t_{SKD1}$ ,  $lt_{PLHD} - t_{PHLD}l$ , Pulse Skew, is the magnitude difference in differential propagation delay time between the positive going edge and the negative going edge of the same channel.

Note 13: t<sub>SKD2</sub>, Channel to Channel Skew, is the difference in propagation delay (t<sub>PLHD</sub> or t<sub>PHLD</sub>) among all output channels in Broadcast mode (any one input to all outputs).

Note 14:  $t_{SKD3}$ , Part to Part Skew, is defined as the difference between the minimum and maximum differential propagation delays. This specification applies to devices at the same  $V_{CC}$  and within 5°C of each other within the operating temperature range.

Note 15: Measured on a clock edge with a histogram and an acummulation of 1500 histogram hits. Input stimulus jitter is subtracted geometrically. Note 16: Tested with a combination of the 1100000101 (K28.5+ character) and 0011111010 (K28.5- character) patterns. Input stimulus jitter is subtracted algebraically.

Note 17: Measured on an eye diagram with a histogram and an acummulation of 3500 histogram hits. Input stimulus jitter is subtracted.

## **Functional Description**

The DS10CP154A is a 1.5 Gbps 4x4 LVDS digital crosspoint switch optimized for high-speed signal routing and switching over lossy FR-4 printed circuit board backplanes and balanced cables. The DS10CP154A operates in two modes: Pin Mode (EN\_smb = 0) and SMBus Mode (EN\_smb = 1).

When in the Pin Mode, the switch is fully configurable with external pins. This is possible with two input select pins per output (e.g. S00 and S01 pins for OUT0).

In the Pin Mode, feedback from the  $\overline{\text{LOS}}$  (Loss **O**f **S**ignal) monitor circuitry is not available (there is not an  $\overline{\text{LOS}}$  output pin).

When in the SMBus Mode, the full switch configuration and  $\overline{\text{SoftPWDN}}$  can be programmed via the SMBus interface. In addition, by using the SMBus interface, a user can obtain the feedback from the built-in  $\overline{\text{LOS}}$  circuitry which detects an open inputs fault condition.

In the SMBus Mode, the S00 and S01 pins become SMBus clock (SCL) input and data (SDA) input pins respectively; the S10, S11, S21 and S21 pins become the User-Set SMBus Slave Address input pins (ADDR0, 1, 2 and 3) while the S30

#### **Switch Configuration Truth Tables**

and S31 pins become non-functional (tieing these two pins to either H or L is recommended if the device will function only in the SMBus mode).

In the SMBus Mode, the PWDN pin remains functional. How this pin functions in each mode is detailed in the following sections.

#### **DS10CP154A OPERATION IN THE PIN MODE**

#### Power Up

In the Pin Mode, when the power is applied to the device power suppy pins, the DS10CP154A enters the Power Up mode when the PWDN pin is set to logic H. When in the Power Down mode (PWDN pin is set to logic L), all circuitry is shut down except the minimum required circuitry for the LOS and SMBus Slave operation.

#### **Switch Configuration**

In the Pin Mode, the DS10CP154A operates as a fully pinconfigurable crosspoint switch. The following truth tables illustrate how the swich can be configured with external pins.

#### TABLE 1. Input Select Pins Configuration for the Output OUT0

| S01 | S00 | INPUT SELECTED |
|-----|-----|----------------|
| 0   | 0   | INO            |
| 0   | 1   | IN1            |
| 1   | 0   | IN2            |
| 1   | 1   | IN3            |

#### TABLE 2. Input Select Pins Configuration for the Output OUT1

| S11 | S10 | INPUT SELECTED |
|-----|-----|----------------|
| 0   | 0   | INO            |
| 0   | 1   | IN1            |
| 1   | 0   | IN2            |
| 1   | 1   | IN3            |

#### TABLE 3. Input Select Pins Configuration for the Output OUT2

| \$21 | S20 | INPUT SELECTED |
|------|-----|----------------|
| 0    | 0   | INO            |
| 0    | 1   | IN1            |
| 1    | 0   | IN2            |
| 1    | 1   | IN3            |

#### TABLE 4. Input Select Pins Configuration for the Output OUT3

| S31 | S30 | INPUT SELECTED |
|-----|-----|----------------|
| 0   | 0   | INO            |
| 0   | 1   | IN1            |
| 1   | 0   | IN2            |
| 1   | 1   | IN3            |

#### DS10CP154A OPERATION IN THE SMBUS MODE

The DS10CP154A operates as a slave on the System Management Bus (SMBus) when the EN\_smb pin is set to a high (1). Under these conditions, the SCL pin is a clock input while the SDA pin is a serial data input pin. slave address are hard wired inside the DS10CP154A and are "101". The four least significant bits of the address are assigned to pins ADDR3-ADDR0 and are set by connecting these pins to GND for a low (0) or to VCC for a high (1). The complete slave address is shown in the following table:

#### **Device Address**

Based on the SMBus 2.0 specification, the DS10CP154A has a 7-bit slave address. The three most significant bits of the

#### TABLE 5. DS10CP154A Slave Address

| 1   | 0 | 1 | ADDR3 | ADDR2 | ADDR1 | ADDR0 |
|-----|---|---|-------|-------|-------|-------|
| MSB |   |   |       |       |       | LSB   |

This slave address configuration allows up to sixteen DS10CP154A devices on a single SMBus bus.

#### Transfer of Data via the SMBus

During normal operation the data on SDA must be stable during the time when SCK is high.

There are three unique states for the SMBus:

**START:** A HIGH to LOW transition on SDA while SCK is high indicates a message START condition.

**STOP:** A LOW to HIGH transition on SDA while SCK is high indicates a message STOP condition.

**IDLE:** If SCK and SDA are both high for a time exceeding tBUF from the last detected STOP condition or if they are high for a total exceeding the maximum specification for tHIGH then the bus will transfer to the IDLE state.

#### SMBus Transactions

A transaction begins with the host placing the DS10CP154A SMBus into the START condition, then a byte (8 bits) is transferred, MSB first, followed by a ninth ACK bit. ACK bits are '0' to signify an ACK, or '1' to signify NACK, after this the host holds the SCL line low, and waits for the receiver to raise the SDA line as an ACKnowledge that the byte has been received.

#### Writing to a Register

To write a register, the following protocol is used (see SMBus 2.0 specification):

1) The Host drives a START condition, the 7-bit SMBus address, and a "0" indicating a WRITE.

2) The Device (Slave) drives an ACK bit ("0").

3) The Host drives the 8-bit Register Address.

4) The Device drives an ACK bit ("0").

5) The Host drives the 8-bit data byte.

6) The Device drives an ACK bit "0".

7) The Host drives a STOP condition.

The WRITE transaction is completed, the bus goes Idle and communication with other SMBus devices may now occur.

#### **Reading From a Register**

To read a register, the following protocol is used (see SMBus 2.0 specification):

1) The Host drives a START condition, the 7-bit SMBus address, and a "0" indicating a WRITE.

- 2) The Device (Slave) drives an ACK bit ("0").
- 3) The Host drives the 8-bit Register Address.
- 4) The Device drives an ACK bit ("0").
- 5) The Host drives a START condition.

6) The Host drives the 7-bit SMBus Address, and a "1" indicating a READ.

7) The Device drives an ACK bit "0".

8) The Device drives the 8-bit data value (register contents).

9) The Host drives a NACK bit "1" indicating end of READ transfer.

10) The Host drives a STOP condition.

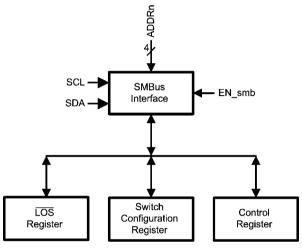

The READ transaction is completed, the bus goes Idle and communication with other SMBus devices may now occur.

#### **REGISTER DESCRIPTIONS**

There are three data registers in the DS10CP154A accessible via the SMBus interface.

#### TABLE 6. DS10CP154A SMBus Data Registers

| Address<br>(hex) | Name                 | Access | Description                                    |  |
|------------------|----------------------|--------|--|--|
| 0                | Switch Configuration | R/W    | Switch Configuration Register                  |  |
| 3                | Control              | R/W    | Powerdown, LOS Enable and Pin Control Register |  |
| 4                | LOS                  | RO     | Loss Of Signal (LOS) Reporting Register        |  |

30073710

FIGURE 5. DS10CP154A Registers Block Diagram

DS10CP154A

#### Switch Configuration Register

The Switch Configuration register is utilized to configure the switch. The following two tables show the Switch Configuration Register mapping and associated truth table.

| Bit    | Default | Bit Name       | Access | Description                                |
|--------|---------|----------------|--------|--|
| D[1:0] | 00      | Input Select 0 | R/W    | Selects which input is routed to the OUT0. |
| D[3:2] | 00      | Input Select 1 | R/W    | Selects which input is routed to the OUT1. |
| D[5:4] | 00      | Input Select 2 | R/W    | Selects which input is routed to the OUT2. |
| D[7:6] | 00      | Input Select 3 | R/W    | Selects which input is routed to the OUT3. |

#### **TABLE 7. Switch Configuration Register Truth Table**

| D1 | D0 | Input Routed to the OUT0 |  |  |
|----|----|--------------------------|--|--|
| 0  | 0  | INO                      |  |  |
| 0  | 1  | IN1                      |  |  |
| 1  | 0  | IN2                      |  |  |
| 1  | 1  | IN3                      |  |  |

The truth tables for the OUT1, OUT2, and OUT3 outputs are identical to this table.

The switch configuration logic has a SmartPWDN circuitry which automatically optimizes the device's power consumption based on the switch configuration (i.e. It places unused I/O blocks and other unused circuitry in the power down state).

#### **Control Register**

The Control register enables SoftPWDN control, individual output power down (PWDNn) control and LOS Circuitry Enable control via the SMBus. The following table shows the register mapping.

| Bit    | Default | Bit Name | Access | Description  |  |
|--------|---------|----------|--------|--|--|
| D[3:0] | 1111    | PWDNn    | R/W    | Writing a [0] to the bit D[n] will power down the output OUTn  |  |
|        |         |          |        | when either the PWDN pin OR the Control Register bit D[7]  |  |
|        |         |          |        | (SoftPWDN) is set to a high [1].   |  |
| D[4]   | x       | n/a      | R/W    | Undefined.   |  |
| D[5]   | x       | n/a      | R/W    | Undefined.   |  |
| D[6]   | 0       | EN_LOS   | R/W    | Writing a [1] to the bit D[6] will enable the $\overline{\text{LOS}}$ circuitry and receivers on all four inputs. The SmartPWDN circuitry will not disable any of the inputs nor any supporting $\overline{\text{LOS}}$ circuitry depending on the switch configuration. |  |
| D[7]   | 0       | SoftPWDN | R/W    | Writing a [0] to the bit D[7] will place the device into the power down mode. This pin is ORed together with the $\overline{\text{PWDN}}$ pin.   |  |

| PWDN | SoftPWDN | PWDNn | DS25CP104 Power Mode  |  |
|------|----------|-------|---|--|
| 0    | 0        | x     | Power Down Mode. In this mode, all circuitry is shut down except the minimum required circuitry for the $\overline{LOS}$ and SMBus Slave operation. The SMBus circuitry allows enabling the $\overline{LOS}$ circuitry and receivers on all inputs in this mode by setting the EN_ $\overline{LOS}$ bit to a [1]. |  |
| 0    | 1        | x     | Power Up Mode. In this mode, the SmartPWDN circuitry will automatically   |  |
| 1    | 0        | x     | power down any unused I/O and logic blocks and other supporting circuitry   |  |
| 1    | 1        | x     | depending on the switch configuration.  |  |
|      |          |       | An output will be enabled only when the SmartPWDN circuitry indicates that  |  |
|      |          |       | that particular output is needed for the particular switch configuration and  |  |
|      |          |       | the respective PWDNn bit has logic high [1].  |  |
|      |          |       | An input will be enabled when the SmartPWDN circuitry indicates that that   |  |
|      |          |       | particular input is needed for the particular switch configuration or the   |  |
|      |          |       | EN_TOS bit is set to a [1].   |  |

#### . .

#### **LOS** Register

The LOS register reports an open inputs fault condition for each of the inputs. The following table shows the register mapping.

| Bit    | Default | Bit Name | Access | Description  |  |
|--------|---------|----------|--------|--|--|
| D[0]   | 0       | LOS0     | RO     | Reading a [0] from the bit D[0] indicates an open inputs fault condition or the IN0. A [1] indicates presence of a valid signal. |  |
| D[1]   | 0       | LOS1     | RO     | Reading a [0] from the bit D[1] indicates an open inputs fault condition on the IN1. A [1] indicates presence of a valid signal. |  |
| D[2]   | 0       | LOS2     | RO     | Reading a [0] from the bit D[2] indicates an open inputs fault condition on the IN2. A [1] indicates presence of a valid signal. |  |
| D[3]   | 0       | LOS3     | RO     | Reading a [0] from the bit D[3] indicates an open inputs fault condition on the IN3. A [1] indicates presence of a valid signal. |  |
| D[7:4] | 0000    | Reserved | RO     | Reserved for future use. Returns undefined value when read.  |  |

DS10CP154A

#### INPUT INTERFACING

The DS10CP154A accepts differential signals and allows simple AC or DC coupling. With a wide common mode range, the DS10CP154A can be DC-coupled with all common dif-

LVDS

OUT-

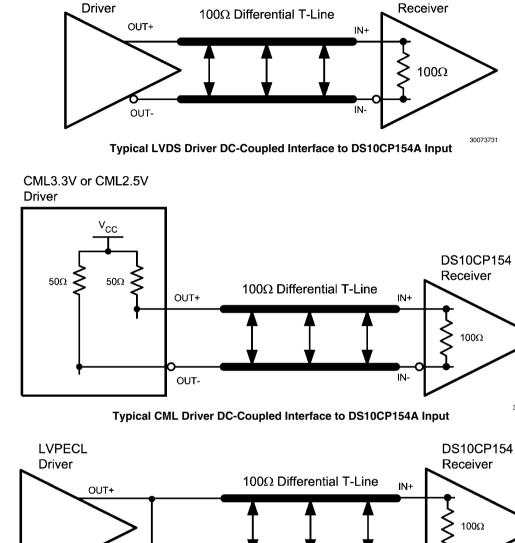

50Ω ≶

ferential drivers (i.e. LVPECL, LVDS, CML). The following three figures illustrate typical DC-coupled interface to common differential drivers. Note that the DS10CP154A inputs are internally terminated with a  $100\Omega$  resistor.

#### LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
