

## MICROPROCESSOR SUPERVISOR WITH WATCHDOG TIMER

### FEATURES

- Fully Programmable Reset Threshold
- Fully Programmable Reset Period
- Fully Programmable Watchdog Period
- 2% Accurate Reset Threshold
- Input Voltage Down to 2 V
- Input 18- $\mu$ A Maximum Input Current
- Reset Valid Down to 1 V

### DESCRIPTION

The UCCx946 is designed to provide accurate microprocessor supervision, including reset and watchdog functions. During power up, the device asserts a reset signal  $\overline{\text{RES}}$  with VDD as low as 1 V. The reset signal remains asserted until the VDD voltage rises and remains above the reset threshold for the reset period. Both reset threshold and reset period are programmable by the user.

The UCCx946 is also resistant to glitches on the VDD line. Once  $\overline{\text{RES}}$  has been deasserted, any drops below the threshold voltage need to be of certain time duration and voltage magnitude to generate a reset signal. These values are shown in Figure 1. An I/O line of the microprocessor may be tied to the watchdog input (WDI) for watchdog functions. If the I/O line is not toggled within a set watchdog period, programmable by the user, WDO is asserted. The watchdog function is disabled during reset conditions.

The UCCx946 is available in 8-pin SOIC(D), 8-pin PDIP (N) and 8-pin TSSOP(PW) packages to optimize board space.

UDG-02192

**ORDERING INFORMATION**

T <sub>A</sub>	PACKAGED DEVICES <sup>(3)</sup>		
	(D)	(N)	(PW)
-40°C to 95°C	UCC2946D	UCC2946N	UCC2946PW
0°C to 70°C	UCC3946D	UCC3946N	UCC3946PW

(1) The D and PW packages are also available taped and reeled. Add an R suffix to the device type (i.e., UCC2946DR) for quantities of 3,000 devices per reel.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**ABSOLUTE MAXIMUM RATINGS**

over operating free-air temperature range unless otherwise noted<sup>(1)</sup>

	UCC2946 UCC3946	UNIT
Input voltage range, V <sub>IN</sub>	10	V
Junction temperature range, T <sub>J</sub>	-55 to 150	°C
Storage temperature, T <sub>stg</sub>	-65 to 150	
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds	300	

(1) Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. Voltages are with respect to GND. Currents are positive into, and negative out of the specified terminal.

**TERMINAL FUNCTIONS**

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
GND	1	-	Ground reference for the device
$\overline{\text{RES}}$	3	O	This pin is high only if the voltage on the RTH has risen above 1.235 V. Once RTH rises above the threshold, this pin remains low for the reset period. This pin asserts low and remains low if the RTH voltage dips below 1.235 V for an amount of time determined by Figure 1.
RTH	2	I	This input compares its voltage to an internal 1.25-V reference. By using external resistors, a user can program any desired reset threshold.
RP	4	I	This pin allows the user to program the reset period by adjusting an external capacitor.
VDD	8	I	Supply voltage for the device.
WDI	7	I	This pin is the input to the watchdog timer. If this pin is not toggled or strobed within the watchdog period, WDO is asserted.
$\overline{\text{WDO}}$	5	O	This pin is the watchdog output. This pin is asserted low if the WDI pin is not strobed or toggled within the watchdog period.
WP	6	I	This pin allows the user to program the watchdog period by adjusting an external capacitor.

**ELECTRICAL CHARACTERISTICS**

$T_A = 0^\circ\text{C}$  to  $70^\circ\text{C}$  and  $2.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$  for the UCC3946,  $T_A = -40^\circ\text{C}$  to  $95^\circ\text{C}$  and  $2.1\text{ V} \leq V_{DD} \leq 5.5\text{ V}$  for the UCC2946, (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

(1) Minimum supply voltage where RES is considered valid.

**APPLICATION INFORMATION**

The UCCx946 supervisory circuit provides accurate reset and watchdog functions for a variety of microprocessor applications. The reset circuit prevents the microprocessor from executing code during undervoltage conditions, typically during power-up and power-down. In order to prevent erratic operation in the presence of noise, voltage glitches where voltage amplitude and time duration are less than the values specified in Figure 1 are ignored.

**Figure 1.**

The watchdog circuit monitors the microprocessor's activity, if the microprocessor does not toggle  $\overline{WDI}$  during the programmable watchdog period  $\overline{WDO}$  goes low, alerting the microprocessor's interrupt of a fault. The  $\overline{WDO}$  pin is typically connected to the non-maskable input of the microprocessor so that an error recovery routine can be executed.

**APPLICATION INFORMATION**

**PROGRAMMING THE RESET VOLTAGE AND RESET PERIOD**

The UCCx946 allows the reset trip voltage to be programmed with two external resistors. In most applications VDD is monitored by the reset circuit, however, the design allows voltages other than VDD to be monitored. Referring to Figure 2, the voltage below which reset is asserted is determined by:

$$V_{\text{RESET}} = 1.235 \times \left( \frac{R1 + R2}{R2} \right) \tag{1}$$

In order to keep quiescent currents low, resistor values in the megaohm range can be used for R1 and R2. A manual reset can be easily implemented by connecting a momentary push switch in parallel with R2.  $\overline{\text{RES}}$  is ensured to be low with VDD voltages as low as 1 V.

UDG-98002

**Figure 2. Typical Application Diagram**

**APPLICATION INFORMATION**

Once VDD rises above the programmed threshold,  $\overline{\text{RES}}$  remains low for the reset period defined by:

$$T_{RP} = 3.125 \times C_{RP} \tag{2}$$

where  $T_{RP}$  is time in milliseconds and  $C_{RP}$  is capacitance in nanofarads.  $C_{RP}$  is charged with a precision current source of 400 nA, a high-quality, low-leakage capacitor (such as an NPO ceramic) should be used to maintain timing tolerances. Figure 3 illustrates the voltage levels and timings associated with the reset circuit.

UDG-97067

- t1: VDD > 1 V,  $\overline{\text{RES}}$  is ensured low.
- t2: VDD > programmed threshold,  $\overline{\text{RES}}$  remains low for TRP.
- t3:  $T_{RP}$  expires,  $\overline{\text{RES}}$  pulls high.
- t4: Voltage glitch occurs, but is filtered at the RTH pin,  $\overline{\text{RES}}$  remains high.
- t5: Voltage glitch occurs whose magnitude and duration is greater than the RTH filter,  $\overline{\text{RES}}$  is asserted for TRP.
- t6: On completion of the TRP pulse the RTH voltage has returned and  $\overline{\text{RES}}$  is pulled high.
- t7: VDD dips below threshold (minus hysteresis),  $\overline{\text{RES}}$  is asserted.

**Figure 3. Reset Circuit Timings**

**APPLICATION INFORMATION**

**PROGRAMMING THE WATCHDOG PERIOD**

The watchdog period is programmed with  $C_{WP}$  as follows:

$$T_{WP} = 25 \times C_{WP} \tag{3}$$

where  $T_{WP}$  is in milliseconds and  $C_{WP}$  is in nanofarads. A high-quality, low-leakage capacitor should be used for  $C_{WP}$ . The watchdog input  $\overline{WDI}$  must be toggled with a high-to-low or low-to-high transition within the watchdog period to prevent  $\overline{WDO}$  from assuming a logic level low.  $\overline{WDO}$  maintains the low logic level until  $\overline{WDI}$  is toggled or  $\overline{RES}$  is asserted. If at any time  $\overline{RES}$  is asserted,  $\overline{WDO}$  assumes a high logic state and the watchdog period be reinitiated. Figure 4 illustrates the timings associated with the watchdog circuit.

UDG-98007

- t1: Microprocessor is reset.
- t2:  $\overline{WDI}$  is toggled some time after reset, but before  $TWP$  expires.
- t3:  $\overline{WDI}$  is toggled before  $TWP$  expires.
- t4:  $\overline{WDI}$  is toggled before  $TWP$  expires.
- t5:  $\overline{WDI}$  is not toggled before  $TWP$  expires and  $\overline{WDO}$  asserts low, triggering the microprocessor to enter an error recovery routine.
- t6: The microprocessor's error recovery routine is executed and  $\overline{WDI}$  is toggled, reinitiating the watchdog timer.
- t7:  $\overline{WDI}$  is toggled before  $TWP$  expires.
- t8:  $\overline{WDI}$  is toggled before  $TWP$  expires.
- t9:  $\overline{RES}$  is momentarily triggered,  $\overline{RES}$  is asserted low for  $TRP$ .
- t10: Microprocessor is reset,  $\overline{RES}$  pulls high.
- t11:  $\overline{WDI}$  is toggled some time after reset, but before  $TWP$  expires.
- t12:  $\overline{WDI}$  is toggled before  $TWP$  expires.
- t13:  $\overline{WDI}$  is toggled before  $TWP$  expires.
- t14:  $VDD$  dips below the reset threshold,  $\overline{RES}$  is asserted.

**Figure 4. Watchdog Circuit Timings**

**APPLICATION INFORMATION**

**CONNECTING  $\overline{WDO}$  TO  $\overline{RES}$**

In order to provide design flexibility, the reset and watchdog circuits in the UCCx946 have separate outputs. Each output independently drives high or low, depending on circuit conditions explained previously.

In some applications, it may be desirable for either the  $\overline{RES}$  or  $\overline{WDO}$  to reset the microprocessor. This can be done by connecting  $\overline{WDO}$  to  $\overline{RES}$ . If the pins try to drive to different output levels, the low output level dominates. Additional current flows from VDD to GND during these states. If the application cannot support additional current (during fault conditions),  $\overline{RES}$  and  $\overline{WDO}$  can be connected to the inputs of an OR gate whose output is connected to the microprocessor's reset pin.

**LAYOUT CONSIDERATIONS**

A 0.1- $\mu$ F capacitor connected from VDD to GND is recommended to decouple the UCCx946 from switching transients on the VDD supply rail.

Since RP and WP are precision current sources, capacitors  $C_{RP}$  and  $C_{WP}$  should be connected to these pins with minimal trace length to reduce board capacitance. Care should be taken to route any traces with high voltage potential or high speed digital signals away from these capacitors.

Resistors R1 and R2 generally have a high ohmic value, traces associated with these parts should be kept short in order to prevent any transient producing signals from coupling into the high impedance RTH pin.

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and

package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46C and to discontinue any product or service per JESD48B. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components which meet ISO/TS16949 requirements, mainly for automotive use. Components which have not been so designated are neither designed nor intended for automotive use; and TI will not be responsible for any failure of such components to meet such requirements.
