Description

The FAN7527B provides simple and high-performance active Power Factor Correction (PFC). The FAN7527B is optimized for electronic ballasts and low–power, high-density power supplies that require minimum board size, reduced external components, and low power dissipation. Because the R/C filter is included in the current-sense block, an external R/C filter is not necessary. Special circuitry prevents no-load runaway conditions. Regardless of the supply voltage, the output drive clamping circuit limits the overshoot of the power MOSFET gate drive, which improves system reliability.

Pin Configuration

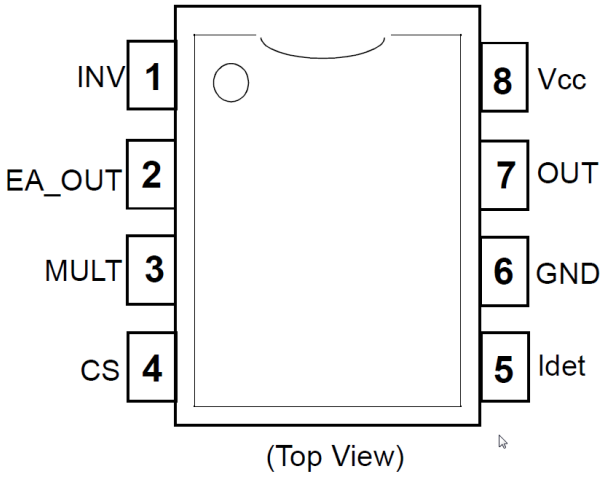

Figure 2. Pin Configuration

Pin Definitions

Pin #	Name	Description
1	INV	Inverting input of the error amplifier. The output of the boost converter should be resistively divided to 2.5 V and connected to this pin.
2	EA_OUT	Output of the error amplifier. Feedback compensation network is placed between this pin and the INV pin.
3	MULT	Input to the multiplier stage. The full-wave rectified AC voltage is divided to less than 2 V and is connected to this pin.
4	CS	Input of the PWM comparator. The MOSFET current is sensed by a resistor and the resulting voltage is applied to this pin. An internal R/C filter is included to reject high-frequency noise.
5	Idet	Zero Current Detection (ZCD) input.
6	GND	Ground
7	OUT	Gate driver output. Push-pull output stage is able to drive the power MOSFET with a peak current of 500 mA.
8	V_{CC}	Supply voltage of driver and control circuits.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.
