

# 2/3/4/5-Phase PWM Controller for High-Density Power Supply

## General Description

The RT8802A is a 2/3/4/5-phase synchronous buck controller specifically designed to power Intel®/AMD next generation microprocessors. It implements an internal 8-bit DAC that is identified by VID code of microprocessor directly. RT8802A generates VID table that conform to Intel® VRD10.x and VRD11 core power with 6.25mV increments and 0.5% accuracy.

RT8802A adopts innovative time-sharing DCR current sensing technique to sense phase currents for phase current balance, load line setting and over current protection. Using a common GM to sense all phase currents eliminates offset and linearity variation between GMs in conventional current sensing methods. As sub-milli-ohm-grade inductors are widely used in modern motherboards, slight offset and linearity mismatch will cause considerable current shift between phases. This technique ensures good current balance in mass production.

Other features include over current protection, programmable soft start, over voltage protection, and output offset setting. RT8802A comes to a small footprint package with VQFN-40L 6x6.

## Ordering Information

Note :

Richtek Pb-free and Green products are :

- ▶RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶Suitable for use in SnPb or Pb-free soldering processes.
- ▶100% matte tin (Sn) plating.

## Features

- 5V Power Supply
- 2/3/4/5-Phase Power Conversion with Automatic Phase Selection
- 8-bit VID Interface, Supporting Intel VRD11/VRD10.x and AMD K8, K8\_M2 CPUs
- VR\_HOT and VR\_FAN Indication
- Precision Core Voltage Regulation
- Power Stage Thermal Balance by DCR Current Sensing
- Adjustable Soft-start
- Over-Voltage Protection
- Adjustable Frequency and Typical at 300kHz per Phase
- Power Good Indication
- 40-Lead VQFN Package
- RoHS Compliant and 100% Lead (Pb)-Free

## Applications

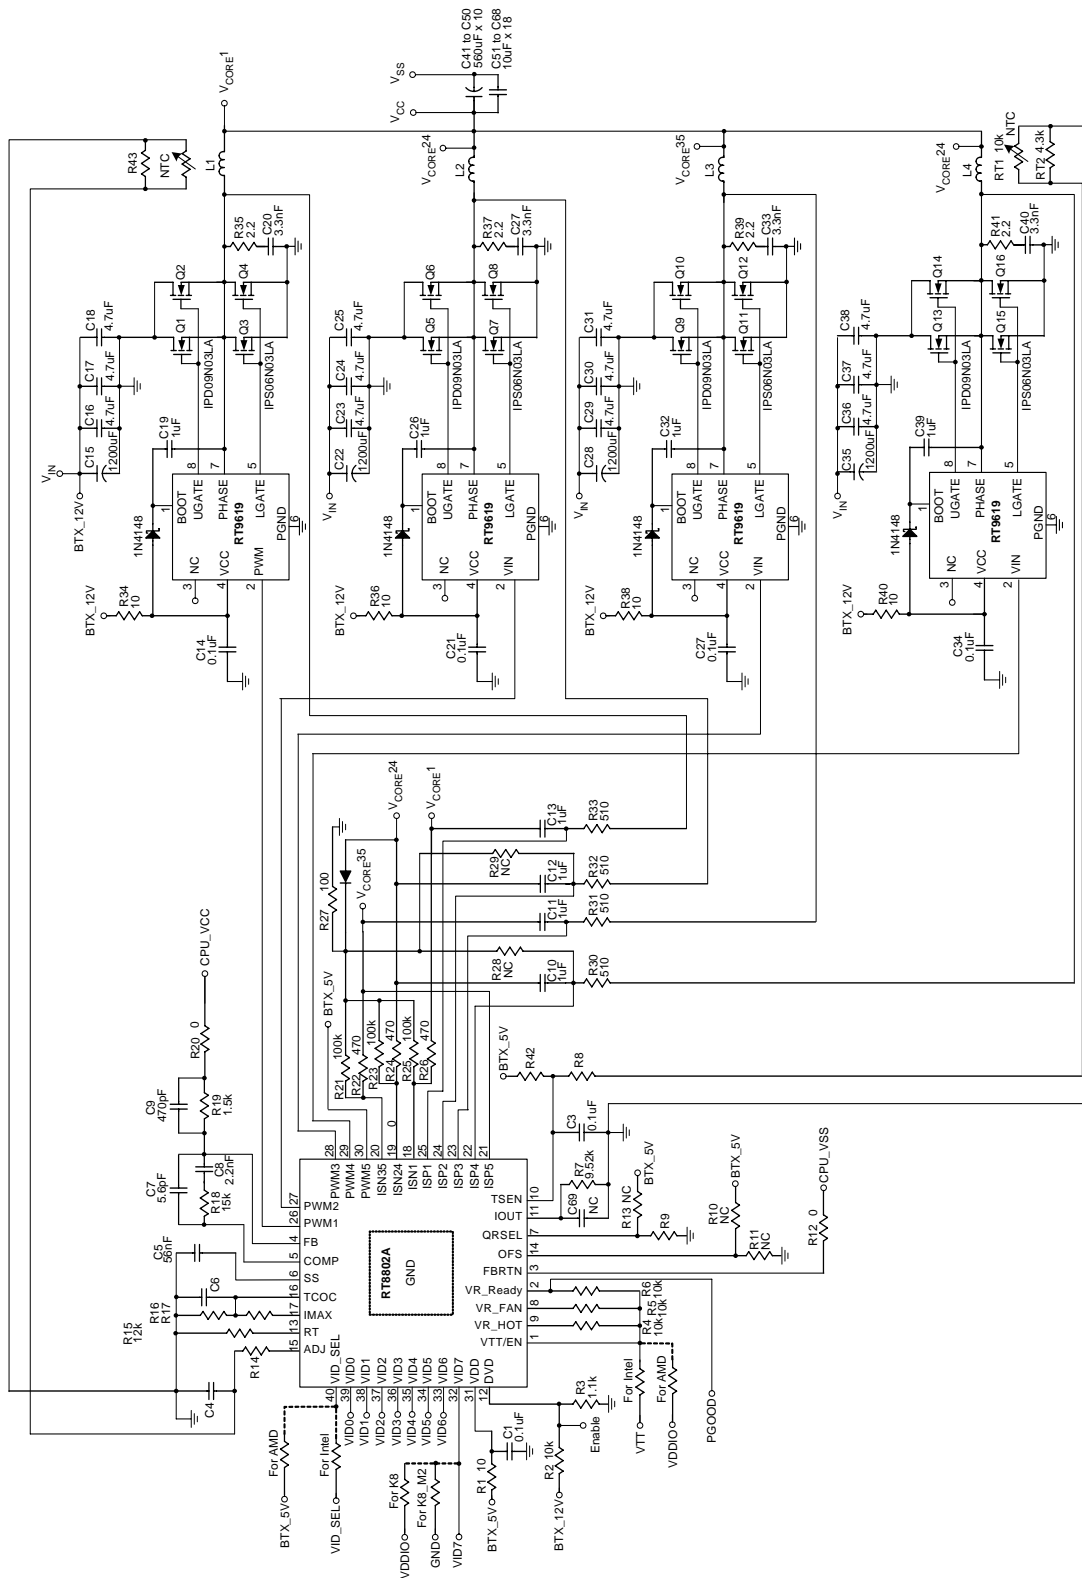

- Intel®/AMD New generation microprocessor for Desktop PC and Motherboard
- Low Output Voltage, High power density DC-DC Converters
- Voltage Regulator Modules

## Pin Configurations

All brandname or trademark belong to their owner respectively

## Typical Application Circuit

All brandname or trademark belong to their owner respectively

## Functional Pin Description

### VTT/EN (Pin 1)

The pin is defined as the chip enable, and the VTT is applied for internal VID pull high power and power sequence monitoring.

### VR\_Ready (Pin 2)

Power good open-drain output.

### FBRTN (Pin 3)

Feedback return pin. VIDDAC and error amplifier reference for remote sensing of the output voltage.

### FB (Pin 4)

Inverting input pin of the internal error amplifier.

### COMP (Pin 5)

Output pin of the error amplifier and input pin of the PWM comparator.

### SS (Pin 6)

Connect this SS pin to GND with a capacitor to set the soft-start time interval.

### QRSEL (Pin 7)

Quick response mode select pin. When QRSEL = GND and quick response is triggered during heavy load to light load transient, 2 channels will turn on simultaneously to prevent  $V_{OUT}$  undershoot. When QRSEL = NC and quick response is triggered, all channels will turn on simultaneously to prevent  $V_{OUT}$  undershoot.

### VR\_FAN (Pin 8)

The pin is defined to signal VR thermal information for external VR thermal dissipation scheme triggering.

### VR\_HOT (Pin 9)

The pin is defined to signal VR thermal information for external VR thermal dissipation scheme triggering.

### TSEN (Pin 10)

Temperature detect pin for VR\_HOT and VR\_FAN.

### IOUT (Pin 11)

Output current indication pin. The current through IOUT pin is proportional to the total output current.

### DVD (Pin 12)

Programmable power UVLO detection input. Trip threshold is 1V at  $V_{DVD}$  rising.

### RT (Pin 13)

The pin is defined to set internal switching operation frequency. Connect this pin to GND with a resistor  $R_{RT}$  to set the frequency  $F_{SW}$ .

$$F_{SW} = \frac{4.463 e^9}{R_{RT} + 3500}$$

### OFS (Pin 14)

The pin is defined for load line offset setting.

### ADJ (Pin 15)

Current sense output for active droop adjusting. Connect a resistor from this pin to GND to set the load droop.

### TCOC (Pin 16)

Input pin for setting thermally compensated over current trigger point. Voltage on the pin is compared with  $V_{ADJ}$ . If  $V_{ADJ} > V_{TCOC}$  then OCP is triggered.

### IMAX (Pin 17)

The pin is defined to set threshold of over current.

### ISN1 (Pin 18)

Current sense negative input pin for channel 1 current sensing.

### ISN24 (Pin 19)

Current sense negative input pins for channel 2 and channel 4 current sensing.

### ISN35 (Pin 20)

Current sense negative input pins for channel 3 and channel 5 current sensing.

**ISP1 (Pin 25), ISP2 (Pin 24), ISP3 (Pin 23),  
ISP4 (Pin 22), ISP5 (Pin 21)**

Current sense positive input pins for individual converter channel current sensing.

**PWM1 (Pin 26), PWM2 (Pin 27), PWM3 (Pin 28),  
PWM4 (Pin 29), PWM5 (Pin 30)**

PWM outputs for each driven channel. Connect these pins to the PWM input of the MOSFET driver. For systems which using 2/3/4 channels, pull PWM 3/4/5 pins up to high.

**VDD (Pin 31)**

IC power supply. Connect this pin to a 5V supply.

**VID7 (Pin 32), VID6 (Pin 33), VID5 (Pin 34), VID4 (Pin 35), VID3 (Pin 36), VID2 (Pin 37), VID1 (Pin 38),  
VID0 (Pin 39), VID\_SEL (40)**

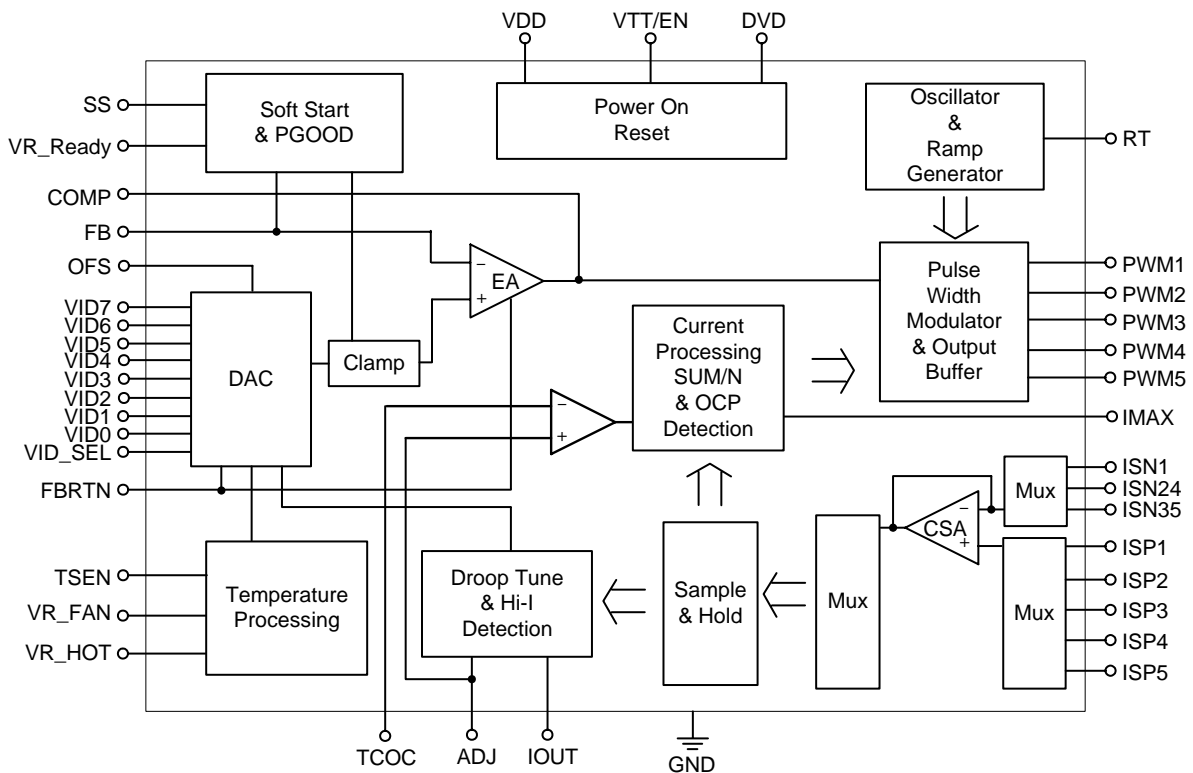

DAC voltage identification inputs for VRD10.x / VRD11 / K8 / K8\_M2 . These pins are internally pulled up to VTT.

VIDSEL	VID [7]	Table
VTT	X	VR11
GND	X	VR10.x
VDD	NC	K8
VDD	GND	K8_M2

**GND [Exposed pad (41)]**

The exposed pad must be soldered to a large PCB and connected to GND for maximum power dissipation.

## Applications Information

RT8802A is a multi-phase DC/DC controller specifically designed to deliver high quality power for next generation CPU. RT8802A controls a special power-on sequence & monitors the thermal condition of VR module to meet the VRD11 requirement. Phase currents are sensed by innovative time-sharing DCR current sensing technique for channel current balance, droop tuning, and over current protection. Using one common GM amplifier for current sensing eliminates offset errors and linearity variation between GMs. As sub-milli-ohm-grade inductors are widely used in modern mother boards, slight mismatch of GM amplifiers offset and linearity results in considerable current shift between phases. The time-sharing DCR current sensing technique is extremely important to guarantee phase current balance in mass production.

### Converter Initialization, Phase Selection, and Power Good Function

The RT8802A initiates only after 3 pins are ready: VDD pin power on reset (POR), VTT/EN pin enabled, and DVD pin is higher than 1V. VDD POR is to make sure RT8802A is powered by a voltage for normal work. The rising threshold voltage of VDD POR is 4.2V typically. At VDD POR, RT8802A checks PWM3, PWM4 and PWM5 status to determine phase number of operation. Pull high PWM3 for two-phase operation; pull high PWM4 for three-phase operation; pull high PWM5 for four-phase operation. The unused current sense pins should be connected to GND or left floating.

VTT/EN acts as a chip enable pin and receives signal from FSB or other power management IC.

DVD is to make sure that ATX12V is ready for drivers to work normally. Connect a voltage divider from ATX12V to DVD pin as shown in the Typical Application Circuit. Make sure that DVD pin voltage is below its threshold voltage before drivers are ready and above its threshold voltage for minimum ATX12V during normal operation.

If any one of VDD, VTT/EN, and DVD is not ready, RT8802A keeps its PWM outputs high impedance and the companion drivers turn off both upper and lower MOSFETs. After VDD, VTT/EN, and DVD are ready, RT8802A initiates its soft start cycle that is compliant

with Intel®VRD11 specification as shown in Figure 1. A time-variant internal current source charges the capacitor connected to SS pin. SS voltage ramps up piecewise linearly and locks VID\_DAC output with a specified voltage drop. Consequently,  $V_{CORE}$  is built up according to VID\_DAC output and meet Intel® VRD11 requirement. VR\_READY output is pulled high by external resistor when  $V_{CORE}$  reaches VID\_DAC output with 1~2ms delay. An SS capacitor about 47nF is recommend for VRD11 compliance.

Figure 1. Timming Diagram During Soft Start Interval

### Voltage Control

CPU  $V_{CORE}$  voltage is Kelvin sensed by FB and FBRTN pins and precisely regulated to VID\_DAC output by internal high gain Error Amplifier (EA). The sensed signal is also used for power good and over voltage function. The typical OVP trip point is 170mV above VID\_DAC output. RT8802A pulls PWM outputs low and latches up upon OVP trip to prevent damaging the CPU. It can only restart by resetting one of VDD, DVD, or VTT/EN pin.

RT8802A supports Intel VRD10.x, VRD11, AMD K8 and AMD K8\_M2 VID specification.

The change of VID\_DAC output at VID on the fly is also smoothed by capacitor connected to SS pin. Consequently,  $V_{core}$  shifts to its new position smoothly as shown in Figure 2.

Figure 2. Vcore Response at VID on the Fly

**DCR Current Sensing**

RT8802A adopts an innovative time-sharing DCR current sensing technique to sense the phase currents for phase current balance (phase thermal balance) and load line regulation as shown in Figure 3. Current sensing amplifier GM samples and holds voltages VCx across the current sensing capacitor Cx by turns in a switching cycle. According to the Basic Circuit Theory, if

$$\frac{I_x}{DCR_x} = R_x \times C_x \text{ then } VC_x = I_{LX} \times DCR_x$$

Consequently, the sensing current  $I_x$  is proportional to inductor current  $I_{LX}$  and is expressed as :

$$I_x = \frac{I_{LX} \times DCR_x}{R_{CSNX}}$$

The sensed current  $I_x$  is used for current balance and droop tuning as described as followed. Since all phases share one common GM, GM offset and linearity variation effect is eliminated in practical applications. As sub-milli-ohm-grade inductors are widely used in modern mother boards, slight mismatch of GM amplifiers offset and linearity results in considerable current shift between phases. The time-sharing DCR current sensing technical is extremely important to guarantee phase current balance in mass production.

**Phase Current Balance**

The sampled and held phase current  $I_x$  are summed and averaged to get the averaged current  $\bar{I}_x$ . Each phase current  $I_x$  then is compared with the averaged current. The difference between  $I_x$  and  $\bar{I}_x$  is injected to corresponding PWM comparator. If phase current  $I_x$  is smaller than the averaged current, RT8802A increases the duty cycle of corresponding phase to increase the phase current accordingly and vice versa.

Figure 3

All brandname or trademark belong to their owner respectively

Figure 4. Load Line and Offset Function

**Output Voltage Offset Function**

To meet Intel® requirement of initial offset of load line, RT8802A provides programmable initial offset function. External resistor  $R_{OFS}$  and voltage source at OFS pin generate offset current  $I_{OFS} = \frac{V_{OFS}}{R_{OFS}}$ , where  $V_{OFS}$  is 1V typical. One quarter of  $I_{OFS}$  flows through  $R_{FB1}$  as shown in Figure 4. Error amplifier would hold the inverting pin equal to  $V_{DAC} - V_{ADJ}$ . Thus output voltage is subtracted from  $V_{DAC} - V_{ADJ}$  for a constant offset voltage.

$$V_{CORE} = V_{DAC} - V_{ADJ} - \frac{R_{FB1}}{4 \times R_{OFS}}$$

A positive output voltage offset is possible by connecting  $R_{OFS}$  to VDD instead of to GND. Please note that when  $R_{OFS}$  is connected to VDD,  $V_{OFS}$  is  $V_{DD} - 2V$  typically and half of  $I_{OFS}$  flows through  $R_{FB1}$ .  $V_{CORE}$  is rewritten as :

$$V_{CORE} = V_{DAC} - V_{ADJ} + \frac{R_{FB1}}{R_{OFS}}$$

**Current Ratio Setting**

Current ratio adjustment is possible as described below. It is important for achieving thermal balance in practical application where thermal conditions between phases are not identical. Figure 5 shows the application circuit of GM for current ratio requirement. According to Basic Circuit Theory

$$V_{Cx} = \frac{\frac{R_{PX}}{R_X + R_{PX}}}{\frac{S R_X \times R_{PX} \times C_X}{R_X + R_{PX}} + 1} \times I_{LX} \times DCRx$$

If  $\frac{L_X}{DCRx} = (R_X // R_{PX}) \times C_x$  then

$$V_{Cx} = \frac{R_{PX}}{R_X + R_{PX}} \times I_{LX} \times DCRx$$

With other phase kept unchanged, this phase would share  $(R_{PX} + R_X) / R_{PX}$  times current than other phases. Figure 6 and 7 show different current ratio setting for the power stage when Phase 4 is programmed 2 times current than other phases. Figure 8 and 9 compare the above current ratio setting results.

Figure 5

Figure 6. GM4 Setting for current ratio function

Figure 7. GM1~3 Setting for current ratio function

Figure 8

Figure 10

Figure 9

**Dead Zone Elimination**

RT8802A samples and holds inductor current at 50% period by time-sharing sourcing a current  $I_x$  to  $R_{CSN}$ . At light load condition when inductor current is not balance, voltage  $V_{Cx}$  across the sensing capacitor would be negative. It needs a negative  $I_x$  to sense the voltage. However, RT8802A CANNOT provide a negative  $I_x$  and consequently cannot sense negative inductor current. This results in dead zone of load line performance as shown in Figure 10. Therefore a technique as shown in Figure 11 is required to eliminate the dead zone of load line at light load condition.

Figure 11. Application circuit of GM

Referring to Figure 11,  $I_x$  is expressed as :

$$I_x = \frac{V_{OUT}}{R_{CSN2}} + \frac{I_{LX\_50\%} \times D_{CRx}}{R_{CSN2}} + \frac{I_{LX\_50\%} \times D_{CRx}}{R_{CSN}} \quad (1)$$

where  $I_{LX\_50\%}$  is the of inductor current at 50% period. To make sure RT8802A could sense the inductor current, right hand side of Equation (1) should always be positive:

$$\frac{V_{OUT}}{R_{CSN2}} + \frac{I_{LX\_50\%} \times D_{CRx}}{R_{CSN2}} + \frac{I_{LX\_50\%} \times D_{CRx}}{R_{CSN}} \geq 0 \quad (2)$$

Since  $R_{CSN} \gg D_{CRx}$  in practical application, Equation (2) could be simplified as :

$$\frac{V_{OUT}}{R_{CSN2}} \geq \left| \frac{I_{LX\_50\%} \times D_{CRx}}{R_{CSN}} \right|$$

All brandname or trademark belong to their owner respectively

For example, assuming the negative inductor current is  $I_{LX\_50\%} = -5A$  at no load, then for

$$R_{CSN} 330\Omega, R_{ADJ} = 160\Omega, V_{OUT} = 1.300V$$

$$\frac{1.3V}{R_{CSN2}} \geq \left| \frac{-5A \times 1m\Omega}{330\Omega} \right|$$

$$R_{CSN2} \leq 85.8k\Omega$$

Choose  $R_{CSN2} = 82k\Omega$

Figure 10 shows that dead zone of load line at light load is eliminated by applying this technique.

**VR\_HOT & VR\_FAN Setting**

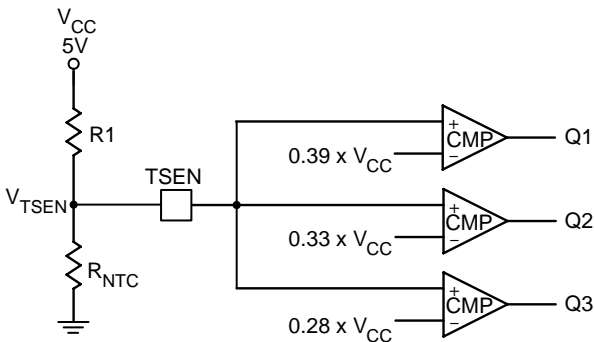

Figure 12

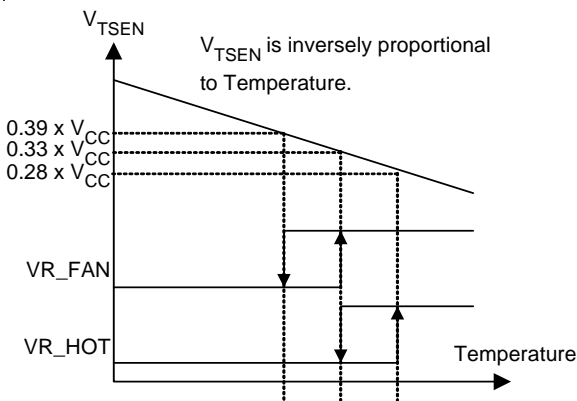

Figure 13. VR\_HOT and VR\_FAN Signal vs TSEN Voltage

**Load Line Setting and Thermal Compensation**

$$V_{ADJ} = \text{Sum}(I_x) \times R_{ADJ} = (DCR \times R_{ADJ} / R_{CSN}) \times I_{OUT}$$

$$= LL \times I_{OUT}$$

$$V_{OUT} = V_{DAC} - V_{ADJ} = V_{DAC} - LL \times I_{OUT}$$

$$LL = DCR(PTC) \times R_{ADJ}(NTC) / R_{CSN}$$

DCR is the inductor DCR which is a PTC resistance.

If  $R_{ADJ}$  is connected as in Figure 14,  $R_{ADJ} = R1 + (R2 // R_{NTC})$ , which is a negative temperature correlated resistance. By properly selecting  $R1$  and  $R2$ , the positive temperature coefficient of DCR can be canceled by the negative temperature coefficient of  $R_{ADJ}$ . Thus the load line will be thermally compensated.

Figure 14.  $R_{ADJ}$  Connection for Thermal Compensation

**Over Current Protection**

**Thermally compensated total current OCP**

$V_{TCOC}$  is compared with  $V_{ADJ}$ . If  $V_{ADJ} > V_{TCOC}$  then OCP is triggered.

Figure 15

**Phase current OCP**

RT8802A uses an external resistor  $R_{IMAX}$  connected to  $I_{MAX}$  pin to generate a reference current  $I_{IMAX}$  for over current protection :

$$I_{IMAX} = \frac{V_{IMAX}}{R_{IMAX}}$$

where  $V_{IMAX}$  is typical 1.0V . OCP comparator compares each sensed phase current  $I_x$  with this reference current as shown in Figure 16. Equivalently, the maximum phase current  $I_{LX(MAX)}$  is calculated as below:

$$\frac{1}{3} I_{X(MAX)} = \frac{1}{2} I_{IMAX}$$

$$I_{X(MAX)} = \frac{3}{2} I_{IMAX} = \frac{3}{2} \times \frac{V_{IMAX}}{R_{IMAX}}$$

$$I_{LX(MAX)} = I_x \times \frac{R_{CSNX}}{DCR_x} = \frac{3}{2} \times \frac{V_{IMAX}}{R_{IMAX}} \times \frac{R_{CSNX}}{R_{LX}}$$

All brandname or trademark belong to their owner respectively
