

# TL493, TL494, TL495 PULSE-WIDTH-MODULATION CONTROL CIRCUITS

D2535, JANUARY 1983—REVISED OCTOBER 1988

- Complete PWM Power Control Circuitry
- Uncommitted Outputs for 200-mA Sink or Source Current
- Output Control Selects Single-Ended or Push-Pull Operation
- Internal Circuitry Prohibits Double Pulse at Either Output
- Variable Dead-Time Provides Control over Total Range
- Internal Regulator Provides a Stable 5-V Reference Supply, 5%
- Circuit Architecture Allows Easy Synchronization
- TL493 has Output Current-Limit Sensing
- TL495 has On-Chip 39-V Zener and External Control of Output Steering

## description

The TL493, TL494, and TL495 each incorporate on a single monolithic chip all the functions required in the construction of a pulse-width-modulation control circuit. Designed primarily for power supply control, these devices offer the systems engineer the flexibility to tailor the power supply control circuitry to his application.

The TL493 contains an error amplifier, current-limiting amplifier, an on-chip adjustable oscillator, a dead-time control comparator, pulse-steering control flip-flop, a 5-volt, 5%-precision regulator, and output-control circuits.

The error amplifier exhibits a common-mode voltage range from  $-0.3$  volts to  $V_{CC} - 2$  volts. The current-limit amplifier exhibits a common-mode voltage range from  $-0.3$  volts to 3 volts with an offset voltage of approximately 80 millivolts in series with the inverting input to ease circuit design requirements. The dead-time control comparator has a fixed offset that provides approximately 5% dead time when externally altered. The on-chip oscillator may be bypassed by terminating  $R_T$  (pin 6) to the reference output and providing a sawtooth input to  $C_T$  (pin 5), or it may be used to drive the common circuits in synchronous multiple-rail power supplies.

## FUNCTION TABLE

INPUTS		OUTPUT FUNCTION
OUTPUT CONTROL	STEERING INPUT (TL495 only)	
$V_I = 0$	Open	Single-ended or parallel output
$V_I = V_{ref}$	Open	Normal push-pull operation
$V_I = V_{ref}$	$V_I = 0$	PWM Output at Q1
$V_I = V_{ref}$	$V_I = V_{ref}$	PWM Output at Q2

PRODUCTION DATA documents contain information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

# TL493, TL494, TL495 PULSE-WIDTH-MODULATION CONTROL CIRCUITS

## description (continued)

The uncommitted output transistors provide either common-emitter or emitter-follower output capability. Each device provides for push-pull or single-ended output operation, which may be selected through the output-control function. The architecture of these devices prohibits the possibility of either output being pulsed twice during push-pull operation.

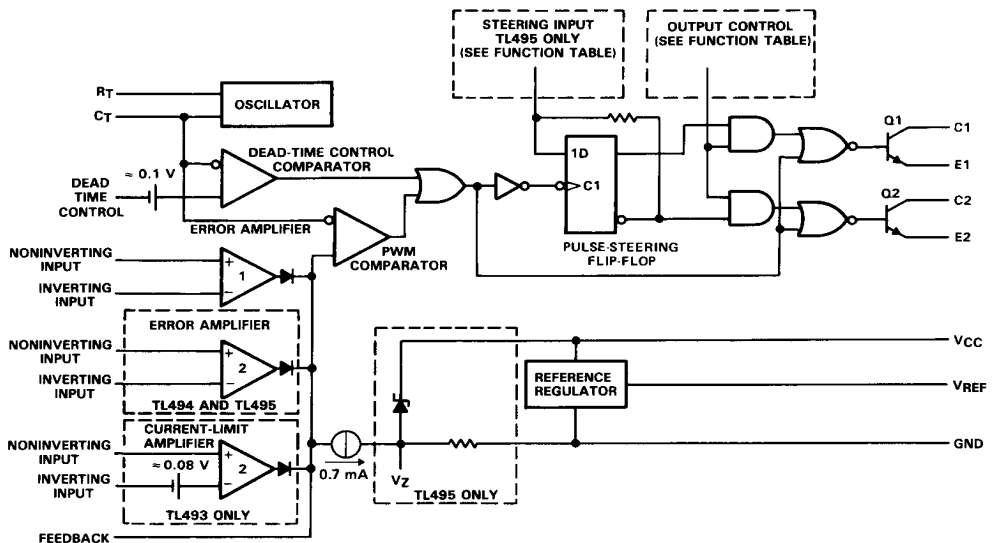

The TL493 and TL494 are similar except that an additional error amplifier is included in the TL494 instead of a current-limiting amplifier. The TL495 provides the identical functions found in the TL494. In addition, it contains an on-chip 39-volt diode for high-voltage applications where  $V_{CC}$  is greater than 40 volts, and an output-steering control that overrides the internal control of the pulse-steering flip-flop.

The TL494I is characterized for operation from  $-25^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ . The TL493C, TL494C, and TL495C are characterized for operation from  $0^{\circ}\text{C}$  to  $70^{\circ}\text{C}$ .

Standard deviation of frequency¶	All values of $V_{CC}$ , $C_T$ , $R_T$ , and $T_A$ constant		10%		
Frequency change with voltage	$V_{CC} = 7\text{ V to }40\text{ V}$ , $T_A = 25^\circ\text{C}$		0.1%		
Frequency change with temperature#	$C_T = 0.01\ \mu\text{F}$ , $R_T = 12\text{ k}\Omega$ , $\Delta T_A = \text{MIN to MAX}$			1%	

## amplifier sections (see Figure 2)

PARAMETER		TEST CONDITIONS	MIN	TYP‡	MAX	UNIT
Input offset voltage	Error					
	Current-limit (TL493 only)	80				
Input offset current		$V_O$ (pin 3) = 2.5 V		25	250	nA
Input bias current		$V_O$ (pin 3) = 2.5 V		0.2	1	$\mu\text{A}$
Common-mode input voltage range	Error	$V_{CC} = 7\text{ V to }40\text{ V}$		-0.3 to $V_{CC} - 2$		V
	Current limit (TL493 only)			-0.3 to 3		
Open-loop voltage amplification	Error	$\Delta V_O = 3\text{ V}$ , $R_L = 2\text{ k}\Omega$ , $V_O = 0.5\text{ V to }3.5\text{ V}$		70	95	dB
	Current-limit (TL493 only)			90		
Unity-gain bandwidth		$V_O = 0.5\text{ V to }3.5\text{ V}$ , $R_L = 2\text{ k}\Omega$		800		kHz
Common-mode rejection ratio	Error	$\Delta V_O = 40\text{ V}$ , $T_A = 25^\circ\text{C}$		65	80	dB
	Current-limit (TL493 only)			70		
Output sink current (pin 3)		$V_{ID} = -15\text{ mV to }-5\text{ V}$ , $V$ (pin 3) = 0.7 V		0.3	0.7	mA
Output source current (pin 3)		$V_{ID} = 15\text{ mV to }5\text{ V}$ , $V$ (pin 3) = 3.5 V		-2		mA

† For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions.

‡ All typical values except for parameter changes with temperature are at  $T_A = 25^\circ\text{C}$ .

§ Duration of the short-circuit should not exceed one second.

¶ Standard deviation is a measure of the statistical distribution about the mean as derived from the formula  $\sigma = \sqrt{\frac{\sum (x_n - \bar{X})^2}{n - 1}}$

# Temperature coefficient of timing capacitor and timing resistor not taken into account.
