description

These monolithic TTL circuits utlize D-type bistables to implement two independent four-bit latches in a single package. Each four-bit latch has an independent asynchronous clear input and a gated two-input enable circuit. When both enable inputs are low, the output levels will follow the data input levels. When either or both of the enable inputs are taken high, the outputs remain at the last levels setup at the inputs prior to the low-to-high-level transition at the enable input(s). After this, the data inputs are locked out.

The clear input is overriding and when taken low will reset all four outputs low regardless of the levels of the enable inputs.

The SN54116 is characterized for operation over the full military temperature range of −55°C to 125°C; the SN74116 is characterized for operation from 0°C to 70°C.

(EACH LATCH)

INPUTS				OUTPUT
CLEAR	ENABLE		DATA	Q
	C1	C2		
H	L	L	L	L
H	L	L	H	H
H	X	H	X	Q_0
H	H	X	X	Q_0
L	X	X	X	L

H = high level, L = low level, X = irrelevant
Q_0 = the level of Q before these input conditions were established.

SWITCHING TIMES FROM DATA INPUTS

NOTES: A. Input pulses are supplied by generators having the following characteristics: $t_r \leq 10$ ns, $t_f \leq 10$ ns, PRR = 1 MHz, duty cycle $\leq$ 50%, $Z_{out} \approx 50\Omega$.
B. C_L includes probe and jig capacitance.
C. All diodes are 1N3064 or equivalent.
D. The other enable input is low.
E. Clear input is high.
