**MOTOROLA**

4-STAGE PRESETTABLE RIPPLE COUNTERS

The SN54/74LS196 decade counter is partitioned into divide-by-two and divide-by-five sections which can be combined to count either in BCD (8, 4, 2, 1) sequence or in a bi-quinary mode producing a 50% duty cycle output. The SN54/74LS197 contains divide-by-two and divide-by-eight sections which can be combined to form a modulo-16 binary counter. Low Power Schottky technology is used to achieve typical count rates of 70 MHz and power dissipation of only 80 mW.

Both circuit types have a Master Reset ($\overline{MR}$) input which overrides all other inputs and asynchronously forces all outputs LOW. A Parallel Load input ($\overline{PL}$) overrides clocked operations and asynchronously loads the data on the Parallel Data inputs (P_n) into the flip-flops. This preset feature makes the circuits usable as programmable counters. The circuits can also be used as 4-bit latches, loading data from the Parallel Data inputs when $\overline{PL}$ is LOW and storing the data when $\overline{PL}$ is HIGH.

- Low Power Consumption — Typically 80 mW
- High Counting Rates — Typically 70 MHz
- Choice of Counting Modes — BCD, Bi-Quinary, Binary
- Asynchronous Presettable
- Asynchronous Master Reset
- Easy Multistage Cascading
- Input Clamp Diodes Limit High Speed Termination Effects

CONNECTION DIAGRAM DIP (TOP VIEW)

V_{CC}	$\overline{MR}$	Q_3	P_3	P_1	Q_1	$\overline{CP}_0$
14	13	12	11	10	9	8

1	2	3	4	5	6	7
$\overline{PL}$	Q_2	P_2	P_0	Q_0	$\overline{CP}_1$	GND

NOTE:
The Flatpak version has the same pinouts (Connection Diagram) as the Dual In-Line Package.

PIN NAMES

|		LOADING (Note a)	
		HIGH	LOW
$\overline{CP}_0$	Clock (Active LOW Going Edge) Input to Divide-by-Two Section	1.0 U.L.	1.5 U.L.
$\overline{CP}_1$ (LS196)	Clock (Active LOW Going Edge) Input to Divide-by-Five Section	2.0 U.L.	1.75 U.L.
$\overline{CP}_1$ (LS197)	Clock (Active LOW Going Edge) Input to Divide-by-Eight Section	1.0 U.L.	0.8 U.L.
$\overline{MR}$	Master Reset (Active LOW) Input	1.0 U.L.	0.5 U.L.
$\overline{PL}$	Parallel Load (Active LOW) Input	0.5 U.L.	0.25 U.L.
P_0–P_3	Data Inputs	0.5 U.L.	0.25 U.L.
Q_0–Q_3	Outputs (Notes b, c)	10 U.L.	5 (2.5) U.L.

NOTES:
a. 1 TTL Unit Load (U.L.) = 40µA HIGH/1.6 mA LOW.
b. The Output LOW drive factor is 2.5 U.L. for Military (54) and 5 U.L. for Commercial (74) Temperature Ranges.
c. In addition to loading shown, Q_0 can also drive $\overline{CP}_1$.

FUNCTIONAL DESCRIPTION

The LS196 and LS197 are asynchronously presettable decade and binary ripple counters. The LS196 Decade Counter is partitioned into divide-by-two and divide-by-five sections while the LS197 is partitioned into divide-by-two and divide-by-eight sections, with all sections having a separate Clock input. In the counting modes, state changes are initiated by the HIGH to LOW transition of the clock signals. State changes of the Q outputs, however, do not occur simultaneously because of the internal ripple delays. When using external logic to decode the Q outputs, designers should bear in mind that the unequal delays can lead to decoding spikes and thus a decoded signal should not be used as a clock or strobe. The CP_0 input serves the Q_0 flip-flop in both circuit types while the CP_1 input serves the divide-by-five or divide-by-eight section. The Q_0 output is designed and specified to drive the rated fan-out plus the CP_1 input. With the input frequency connected to CP_0 and Q_0 driving CP_1, the LS197 forms a straightforward module-16 counter, with Q_0 the least significant output and Q_3 the most significant output.

The LS196 Decade Counter can be connected up to operate in two different count sequences, as indicated in the tables of Figure 2. With the input frequency connected to CP_0 and with Q_0 driving CP_1, the circuit counts in the BCD (8, 4, 2, 1) sequence. With the input frequency connected to CP_1 and Q_3 driving CP_0, Q_0 becomes the low frequency output and has a 50% duty cycle waveform. Note that the maximum counting rate is reduced in the latter (bi-quinary) configuration because of the interstage gating delay within the divide-by-five section.

The LS196 and LS197 have an asynchronous active LOW Master Reset input (MR) which overrides all other inputs and forces all outputs LOW. The counters are also asynchronously presettable. A LOW on the Parallel Load input (PL) overrides the clock inputs and loads the data from Parallel Data ($P_0 - P_3$) inputs into the flip-flops. While PL is LOW, the counters act as transparent latches and any change in the P_n inputs will be reflected in the outputs.

Figure 2. LS196 COUNT SEQUENCES

DECADE (NOTE 1)					BI-QUINARY (NOTE 2)				
COUNT	Q_3	Q_2	Q_1	Q_0	COUNT	Q_0	Q_3	Q_2	Q_1
0	L	L	L	L	0	L	L	L	L
1	L	L	L	H	1	L	L	L	H
2	L	L	H	L	2	L	L	H	L

DEFINITIONS OF TERMS

SETUP TIME (t_S) — is defined as the minimum time required for the correct logic level to be present at the logic input prior to the clock transition from HIGH to LOW in order to be recognized and transferred to the outputs.

HOLD TIME (t_h) — is defined as the minimum time following the clock transition from HIGH to LOW that the logic level must be maintained at the input in order to ensure continued recog-

nition. A negative HOLD TIME indicates that the correct logic level may be released prior to the clock transition from HIGH to LOW and still be recognized.

RECOVERY TIME (t_{rec}) — is defined as the minimum time required between the end of the reset pulse and the clock transition from HIGH to LOW in order to recognize and transfer LOW Data to the Q outputs.
