## 1.0 EZ-USB FX2 Features

Cypress's EZ-USB FX2 is the world's first USB 2.0 integrated microcontroller. By integrating the USB 2.0 transceiver, SIE, enhanced 8051 microcontroller and a programmable peripheral interface in a single chip, Cypress has created a very cost-effective solution that provides superior time-to-market advantages. The ingenious architecture of FX2 results in data transfer rates of 56 Mbytes per second, the maximum allowable USB 2.0 bandwidth, while still using a low-cost 8051 microcontroller in a package as small as a 56 SSOP. Because it incorporates the USB 2.0 transceiver, the FX2 is more economical providing a smaller footprint solution than USB 2.0 SIE or external transceiver implementations. With EZ-USB FX2, the Cypress Smart SIE handles most of the USB 1.1 and 2.0 protocol in hardware, freeing the embedded microcontroller for application specific functions and decreasing development time to ensure USB compatibility. The General Programmable Interface (GPIF) and Master / Slave Endpoint FIFO (8 or 16 bit data bus) provides an easy and glueless interface to popular interfaces such as ATA, UTOPIA, EPP, PCMCIA and most DSP/processors.

Three packages are defined for the family: 56 SSOP, 100 TQFP, and 128 TQFP.

**Figure 1-1. Block Diagram**

- Single-chip integrated USB 2.0 Transceiver, Serial Interface Engine (SIE), and Enhanced 8051 Microprocessor
  - Soft: 8051 runs from internal RAM, which is:
    - Downloaded via USB, or
    - Loaded from EEPROM
  - 4 programmable BULK / INTERRUPT / ISOCHRONOUS
  - 8- or 16-bit external data interface
  - General Programmable Interface (GPIF)
    - Allows direct connection to most parallel interfaces; 8- and 16-bit
    - Programmable waveform descriptors and configuration registers to define waveforms
    - Supports multiple Ready (RDY) inputs and Control (CTL) outputs
  - Integrated, industry standard 8051 with enhanced features:
    - Up to 48-MHz clock rate
    - Four clocks per instruction cycle
    - Two UARTS

- Three counter/timers
- Expanded interrupt system
- Two data pointers
- 3.3-volt operation
- Smart Serial Interface Engine (SIE)
- Vectored USB interrupts
- Separate data buffers for the SETUP and DATA portions of a CONTROL transfer
- Integrated I<sup>2</sup>C Compatible controller, runs at 100 or 400 kHz
- 48-MHz, 24-MHz, or 12-MHz 8051 operation
- Four integrated FIFOs
  - Brings glue and FIFOs inside for lower system cost
  - Automatic conversion to and from 16-bit buses
  - Master or Slave operation
  - FIFOs can use externally supplied clock or asynchronous strobes
  - Easy interface to ASIC and DSP ICs
- Special Autovectors for FIFO and GPIF interrupts
- Up to 40 general purpose I/Os
- Three package options—128-pin TQFP, 100-pin TQFP, and 56-pin SSOP

## 2.0 Applications

- DSL Modems
- ATA Interface
- Memory Card Readers
- Legacy Conversion Devices
- Cameras
- Scanners
- Home PNA
- Wireless LAN
- MP3 Players
- Networking

## 3.0 Functional Overview

### 3.1 USB Signaling Speed

FX2 operates at two of the three rates defined in the Universal Serial Bus Specification Revision 2.0, dated April 27, 2000:

- Full speed, with a signaling bit rate of 12 Mbits/s
- High speed, with a signaling bit rate of 480 Mbits/s

FX2 does not support the low-speed signaling mode of 1.5 Mbits/s.

### 3.2 8051 Microprocessor

The 8051 microprocessor embedded in the FX2 family has 256 bytes of register RAM, an expanded interrupt system, 3 timer/counters and 2 UARTs.

#### 3.2.1 8051 Clock Frequency

FX2 has an on-chip oscillator circuit that uses an external 24-MHz ( $\pm 100$  ppm) crystal with the following characteristics:

- Parallel resonant
- Fundamental mode
- 500  $\mu$ W drive level
- 27–33 pF (5% tolerance) load capacitors

An on-chip PLL multiplies the 24-MHz oscillator up to 480 MHz, as required by the transceiver/PHY, and internal counters divide it down for use as the 8051 clock. The default 8051 clock frequency is 48 MHz. If an EEPROM is connected and certain EEPROM configuration bits are set, the 8051 can also run at 24 MHz or 12 MHz. The 8051 clock rate is set at boot time, as the EEPROM

is read before the 8051 is out of reset. This rate cannot be modified once the 8051 is running. The 8051 may examine internal register bits to determine the frequency at which it is operating.

The CLKOUT pin, which can be three-stated and inverted using internal control bits, outputs the 50% duty cycle 8051 clock, at the selected 8051 clock frequency—48, 24, or 12 MHz.

### 3.2.2 UARTs

FX2 contains two standard 8051 UARTS, addressed via Special Function Register (SFR) bits. The UART interface pins are available on separate I/O pins, and are not multiplexed with port pins.

UART0 and UART1 can operate using an internal clock at 230 KBaud with no more than 1% baud rate error. 230-KBaud operation is achieved by an internally derived clock source that generates overflow pulses at the appropriate time. The internal clock adjusts for the 8051 clock rate (48, 24, 12 MHz) such that it always presents the correct frequency for 230-KBaud operation.

**NOTE:** 115-KBaud operation is also possible by programming the 8051 SMOD0 or SMOD1 bits to a “1”, for UART0 and/or UART1, respectively.

### 3.2.3 Special Function Registers (SFR)

Certain 8051 SFR addresses are populated to provide fast access to critical FX2 functions. These SFR additions are shown in *Table 3-1*. Bold type indicates non-standard, enhanced 8051 registers.

The two SFR rows that end with “0” and “8” contain bit-addressable registers. The four I/O ports A–D use the SFR addresses used in the standard 8051 for ports 0–3, which are not implemented in FX2.

Because of the faster and more efficient SFR addressing, the FX2 I/O ports are not addressable in external RAM space (using the MOVX instruction).

## 3.3 I<sup>2</sup>C Compatible Bus

FX2 supports the I<sup>2</sup>C compatible bus as a master only at 100/400 kbits/s. SCL and SDA pins have open-drain outputs and hysteresis inputs. These signals must be pulled up to 3.3V, even if no I<sup>2</sup>C compatible device is connected.

## 3.4 Buses

All packages: 8- or 16-bit “FIFO” bidirectional data bus, multiplexed on I/O ports B and D.

128-pin package: adds 16-bit output-only 8051 address bus, 8-bit bidirectional data bus.

### 3.5 USB Boot Methods

During the power-up sequence, internal logic checks the I<sup>2</sup>C compatible port for the connection of an EEPROM whose first byte is either 0xC0 or 0xC2. If found, it uses the VID/PID/DID values in the EEPROM in place of the internally stored values (0xC0), or it boot-loads the EEPROM contents into internal RAM (0xC2). If no EEPROM is detected, FX2 enumerates using internally stored descriptors. The default ID values for FX2 are VID/PID/DID (0x04B4, 0x8613, 0x0000).

NOTE: The I<sup>2</sup>C compatible bus SCL and SDA pins must be pulled up, even if an EEPROM is not connected. Otherwise this detection method does not work properly.

### 3.6 Interrupt System

#### 3.6.1 INT2 Interrupt Request & Enable Registers

FX2 implements an autovector feature for INT2 and INT4. There are 27 INT2 (USB) vectors, and 14 INT4 (FIFO/GPIF) vectors. See FX2 TRM for more details.

### 3.7 Reset and Wakeup

#### 3.7.1 Reset Pin

An input pin (RESET#) resets the chip. This pin has hysteresis and is active LOW. The internal PLL stabilizes approximately 200 µs after V<sub>CC</sub> has reached 3.3 volts. Typically, an external RC network (R=100k, C=0.1 µF) is used to provide the RESET# signal.

#### 3.7.2 Wake Up Pins

The 8051 puts itself and the rest of the chip into a power-down mode by setting PCON.0=1. This stops the oscillator and PLL. When WAKEUP is asserted by external logic, the oscillator restarts and after the PLL stabilizes, and the 8051 receives a wakeup interrupt. This applies whether or not FX2 is connected to the USB.

The FX2 exits the power down (USB suspend) state using one of the following methods:

- USB bus signals resume
- External logic asserts the WAKEUP pin
- External logic asserts the PA3/WU2 pin

The second wakeup pin, WU2, can also be configured as a general purpose I/O pin. This allows a simple external R-C network to be used as a periodic wakeup source.

### 3.8 Program/Data RAM

#### 3.8.1 Size

The FX2 has 8 kbytes of internal program/data RAM, where PSEN#/RD# signals are internally ORed to allow the 8051 to access it as both program and data memory. No USB control registers appear in this space.

Two memory maps are shown in the following diagrams:

*Figure 3-1. Internal Code Memory, EA=0*

*Figure 3-2. External Code Memory, EA=1*

#### 3.8.2 Internal Code Memory, EA=0

This mode implements the internal 8 kbytes block of RAM (starting at 0) as combined code and data memory. When external RAM or ROM is added, the external read and write strobes are suppressed for memory spaces that exist inside the chip. This allows the user to connect a 64-kbyte memory without requiring address decodes to keep clear of internal memory spaces.

Only the **internal 8kbytes** and **scratch pad** 0.5 kbytes RAM spaces have the following access:

- USB download
- USB upload
- SetupData Pointer
- I<sup>2</sup>C compatible interface boot load

\*SUDPTR, USB upload/download, I<sup>2</sup>C compatible interface boot access

**Figure 3-1. Internal Code Memory, EA=0**

### 3.8.3 External Code Memory, EA=1

The bottom 8 kbytes of program memory is external, and therefore the bottom 8 kbytes of internal RAM is accessible only as data memory.

\*SUDPTR, USB upload/download, I<sup>2</sup>C compatible interface boot access

**Figure 3-2. External Code Memory, EA=1**

### 3.9 Register Addresses

**Figure 3-3. Data RAM**

### 3.10 Endpoint RAM

#### 3.10.1 Size

- 3x64 bytes (Endpoints 0 and 1)
- 8x512 bytes (Endpoints 2,4,6,8)

#### 3.10.2 Organization

- EP0 Bidirectional endpoint zero, 64-byte buffer.
- EP1IN, EP1OUT 64-byte buffers, bulk or interrupt
- EP2,4,6,8 Eight 512-byte buffers, bulk, interrupt, or isochronous. EP2 & 6 can be either double, triple, or quad buffered. For High-Speed endpoint configuration options see *Figure 3-4*.

#### 3.10.3 Setup Data Buffer

A separate 8-byte buffer at 0xE6B8-0xE6BF holds the SETUP data from a CONTROL transfer.

### 3.10.4 Endpoint Configurations (High speed mode)

**Figure 3-4. Endpoint Configuration**

Endpoints 0 and 1 are the same for every configuration. Endpoint zero is the only CONTROL endpoint, and endpoint 1 can be either BULK or INTERRUPT. To the left of the vertical line, the user may pick different configurations for EP2&4 and EP6&8, since none of the 512 byte buffers are combined between these endpoint groups. An example endpoint configuration would be:

EP2—1024 double buffered; EP6—512 quad buffered.

To the right of the vertical line, buffers are shared between EP2-8, and therefore only entire columns may be chosen.

### 3.10.5 Default Full-Speed Alternate Settings

**Table 3-2. Default Full-Speed Alternate Settings**

Alternate Setting	0	1	2	3
ep0	64	64	64	64
ep1out	0	64 bulk	64 int	64 int
ep1in	0	64 bulk	64 int	64 int
ep2	0	64 bulk out (2x)	64 int out (2x)	64 iso out (2x)
ep4	0	64 bulk out (2x)	64 bulk out (2x)	64 bulk out (2x)
ep6	0	64 bulk in (2x)	64 int in (2x)	64 iso in (2x)
ep8	0	64 bulk in (2x)	64 bulk in (2x)	64 bulk in (2x)

NOTE: "0" means "not implemented"

NOTE: "2x" means "double buffered"

### 3.10.6 Default High-Speed Alternate Settings

**Table 3-3. Default High-Speed Alternate Settings**

Alternate Setting	0	1	2	3
ep0	64	64	64	64
ep1out	0	512 bulk*	64 int	64 int
ep1in	0	512 bulk*	64 int	64 int
ep2	0	512 bulk out (2x)	512 int out (2x)	512 iso out (2x)
ep4	0	512 bulk out (2x)	512 bulk out (2x)	512 bulk out (2x)
ep6	0	512 bulk in (2x)	512 int in (2x)	512 iso in (2x)
ep8	0	512 bulk in (2x)	512 bulk in (2x)	512 bulk in (2x)

**NOTE:** "0" means "not implemented"

**NOTE:** "2x" means "double buffered"

\*Note: Even though these buffers are 64 bytes, they are reported as 512 for USB 2.0 compliance. The user must never transfer packets larger than 64 bytes to EP1.

## 3.11 External FIFO interface

### 3.11.1 Architecture

The FX2 slave FIFO architecture has eight 512-byte blocks in the endpoint RAM which directly serve as FIFO memories, and are controlled by FIFO control signals (such as IFCLK, SLRD, SLWR, SLOE, PKTEND, and flags).

In operation, some of the eight RAM blocks fill or empty from the SIE, while the others are connected to the I/O transfer logic. The transfer logic takes two forms, the GPIF for internally generated control signals, or the slave FIFO interface for externally controlled transfers.

### 3.11.2 Master/Slave Control Signals

The FX2 endpoint FIFOs are implemented as eight physically distinct 256x16 RAM blocks. The 8051/SIE can switch any of the RAM blocks between two domains, the USB(SIE) domain and the 8051-I/O Unit domain. This switching is done virtually instantaneously, giving essentially zero transfer time between "USB FIFOs" and "Slave FIFOs." Since they are physically the same memory, no bytes are actually transferred between buffers.

At any given time, some RAM blocks are filling/emptying with USB data under SIE control, while other RAM blocks are available to the 8051 and/or the I/O control unit. The RAM blocks operate as single-port in the USB domain, and dual-port in the 8051-I/O domain. The blocks can be configured as single, double, triple, or quad buffered as previously shown.

The I/O control unit implements either an internal-master (M for master) or external-master (S for Slave) interface.

In Master (M) mode, the GPIF internally controls FIFOADR[1..0] to select a FIFO. The RDY pins (two in the 56-pin package, six in the 100-pin and 128-pin packages) can be used as flag inputs from an external FIFO or other logic if desired. The GPIF can be run from either an internally derived clock or externally supplied clock (IFCLK), at a rate that transfers data up to 96 Megabytes/s (48 MHz).

In Slave (S) mode, the FX2 accepts either an internally derived clock or externally supplied clock (IFCLK, max. frequency 48 MHz) and SLD, SLRD, SLWR, SLOE, PKTEND signals from external logic. Each endpoint can individually be selected for byte or word operation by an internal configuration bit, and a Slave FIFO Output Enable signal SLOE enables data of the selected width. External logic must insure that the output enable signal is inactive when writing data to a slave FIFO. The slave interface can also operate asynchronously, where the SLD and SLWR signals act directly as strobes, rather than a clock qualifier as in synchronous mode.

### 3.11.3 GPIF and FIFO clock rates

An 8051 register bit selects one of two frequencies for the internally supplied interface clock: 30 MHz and 48 MHz. Alternatively, an externally supplied clock, of up to 48 MHz, feeding the IFCLK pin can be used as the interface clock. IFCLK can be configured to function as an output clock when the GPIF and FIFOs are internally clocked. An output enable bit in the IFCONFIG register turns this clock output off, if desired.

### 3.12 GPIF

The GPIF is a flexible 8- or 16-bit parallel interface driven by a user-programmable finite state machine. It allows the CY7C68013 to perform local bus mastering, and can implement a wide variety of protocols such as ATA interface, printer parallel port, and Utopia.

The GPIF has six programmable control outputs (CTL), nine address outputs (GPIFADR<sub>x</sub>), and six general purpose ready inputs (RDY). The data bus width can be 8 or 16 bits. Each GPIF vector defines the state of the control outputs, and determines what state a ready input (or multiple inputs) must be before proceeding. The GPIF vector can be programmed to advance a FIFO to the next data value, advance an address, etc. A sequence of the GPIF vectors make up a single waveform that will be executed to perform the desired data move between the CY7C68013 and the external design.

#### 3.12.1 Six Control OUT Signals

The 100- and 128-pin packages bring out all six Control Output pins (CTL0-CTL5). The 8051 programs the GPIF unit to define the CTL waveforms. The 56-pin package brings out three of these signals, CTL0-CTL2. CTL<sub>x</sub> waveform edges can be programmed to make transitions as fast as once per clock (20.8 ns using a 48-MHz clock).

#### 3.12.2 Six Ready IN Signals

The 100- and 128-pin packages bring out all six Ready inputs (RDY0-RDY5). The 8051 programs the GPIF unit to test the RDY pins for GPIF branching. The 56-pin package brings out two of these signals, RDY0-1.

#### 3.12.3 Nine GPIF Address OUT signals

Nine GPIF address lines are available in the 100- and 128-pin packages, GPIFADR[8..0]. The GPIF address lines allow indexing through up to a 512 byte block of RAM. If more address lines are needed, I/O port pins can be used.

#### 3.12.4 Long Transfer Mode

In master mode, the 8051 appropriately sets two FIFO transaction count registers (EPxTCH and EPxTCL, where x is either 2, 4, 6, or 8) for unattended transfers of up to 65,536 bytes. The GPIF automatically throttles data flow to prevent under or overflow until the full number of requested transactions complete.

### 3.13 USB Uploads and Downloads

The core has the ability to directly edit the data contents of the internal 8 kbytes RAM and of the internal 512 bytes scratch pad RAM via a vendor specific command. This capability is normally used when "soft" downloading user code and is available only to and from internal RAM, whether the 8051 is held in reset or running. The available RAM spaces are 8 kbytes from 0x0000-0x1FFF (code/data) and 512 bytes from 0xE000-0xE1FF (scratch pad RAM).

Note: A "loader" running in internal RAM can be used to transfer downloaded data to external memory.

### 3.14 Autopointer Access

FX2 provides two identical autopointers. They are similar to the internal 8051 data pointers, but with an additional feature: they can optionally increment a pointer address after every memory access. This capability is available to and from both internal and external RAM. The autopointers are available in SFRs and external FX2 registers, under control of a mode bit (APTRSETUP). When using the SFR autopointer registers the available RAM spaces are internal only: 8 kbytes from 0x0000-0x1FFF and 512 bytes from 0xE000-0xE1FF. Using the external FX2 autopointer access (at 0xE67B-0xE67C) allows the autopointer to access all RAM, internal and external to the part. Also, the autopointers can point to any FX2 register or endpoint buffer space. When autopointer access to external memory is enabled, location 0xE67B and 0xE67C in XDATA and PDATA space cannot be used.

### 3.15 I<sup>2</sup>C Compatible Controller

FX2 has one I<sup>2</sup>C compatible port that is driven by two internal controllers, one that automatically operates at boot time to load VID/PID/DID and configuration information, and another that the 8051, once running, uses to control external I<sup>2</sup>C compatible devices. The I<sup>2</sup>C compatible port operates in master mode only.

#### 3.15.1 I<sup>2</sup>C Compatible Port Pins

The I<sup>2</sup>C compatible pins SCL and SDA must have external 2.2-kΩ pull-up resistors. External EEPROM device address pins must be configured properly. See *Figure 3-4* for configuring the device address pins.

**Table 3-4. Strap Boot EEPROM Address Lines to These Values**

<b>Bytes</b>	<b>Example EEPROM</b>	<b>A2</b>	<b>A1</b>	<b>A0</b>
16	24LC00*	N/A	N/A	N/A
128	24LC01	0	0	0
256	24LC02	0	0	0
4K	24LC32	0	0	1
8K	24LC64	0	0	1

\* This EEPROM does not have address pins

### 3.15.2 I<sup>2</sup>C Compatible Interface Boot Load Access

At power-on reset the I<sup>2</sup>C compatible interface boot loader will load the VID/PID/DID and up to 8 kbytes of program/data. The available RAM spaces are 8 kbytes from 0x0000-0x1FFF and 512 bytes from 0xE000-0xE1FF. The 8051 will be in reset. I<sup>2</sup>C compatible interface boot loads only occur after power-on reset.

### 3.15.3 I<sup>2</sup>C Compatible Interface General Purpose Access

The 8051 can control peripherals connected to the I<sup>2</sup>C compatible bus using the I2CTL and I2DAT registers. FX2 provides I<sup>2</sup>C compatible master control only, it is never an I<sup>2</sup>C compatible slave.

## 4.0 Pin Assignments

Figure 4-1 identifies all signals for the three package types. The following pages illustrate the individual pin diagrams, plus a combination diagram showing which of the full set of signals are available in the 128-, 100-, and 56-pin packages.

The 56-pin package is the lowest-cost version. The signals on the left edge of the 56-pin package in Figure 4-1 are common to all versions in the FX2 family. Three modes are available in all package versions: Port, GPIF master, and Slave FIFO. These modes define the signals on the right edge of the diagram. The 8051 selects the interface mode using the IFCONFIG[1:0] register bits. Port mode is the power-on default configuration.

The 100-pin package adds functionality to the 56-pin package by adding these pins:

- PORTC or alternate GPIFADR[7...0] address signals
- PORTE or alternate GPIFADR8 address signals and 7 more 8051 signals
- 3 GPIF Control signals
- 4 GPIF Ready signals
- Nine 8051 signals (two UARTS, three timer inputs, INT4, and INT5#)
- BKPT, RD#, WR#

The 128-pin package is the full version, adding the 8051 address and data buses plus control signals. Note that two of the required signals, RD# and WR#, are present in the 100-pin version. In the 100-pin and 128-pin versions, an 8051 control bit can be set to pulse the RD# and WR# pins when the 8051 reads from/writes to PORTC.

## 4.1 CY7C68013 Pin Descriptions

**Table 4-1. FX2 Pin Descriptions**

128	100	56	Name	Type	Default	Description
10	9	10	AVCC	Power	N/A	<b>Analog V<sub>CC</sub>.</b> This signal provides power to the analog section of the chip.
13	12	13	AGND	Power	N/A	<b>Analog Ground.</b> Connect to ground with as short a path as possible.
19	18	16	USBD-	I/O/Z	Z	<b>USB D- Signal.</b> Connect to the USB D- signal.
18	17	15	USBD+	I/O/Z	Z	<b>USB D+ Signal.</b> Connect to the USB D+ signal.
94			A0	Output	L	<b>8051 Address Bus.</b> This bus is driven at all times. When the 8051 is addressing internal RAM it reflects the internal address.
95			A1	Output	L	
96			A2	Output	L	
97			A3	Output	L	
117			A4	Output	L	
118			A5	Output	L	
119			A6	Output	L	
120			A7	Output	L	
126			A8	Output	L	
127			A9	Output	L	
128			A10	Output	L	
21			A11	Output	L	
22			A12	Output	L	
23			A13	Output	L	
24			A14	Output	L	
25			A15	Output	L	
59			D0	I/O/Z	Z	<b>8051 Data Bus.</b> This bidirectional bus is high-impedance when inactive, input for bus reads, and output for bus writes. The data bus is used for external 8051 program and data memory. The data bus is active only for external bus accesses, and is driven LOW in suspend.
60			D1	I/O/Z	Z	
61			D2	I/O/Z	Z	
62			D3	I/O/Z	Z	
63			D4	I/O/Z	Z	
86			D5	I/O/Z	Z	
87			D6	I/O/Z	Z	
88			D7	I/O/Z	Z	
39			PSEN#	Output	H	<b>Program Store Enable.</b> This active-LOW signal indicates an 8051 code fetch from external memory. It is active for program memory fetches from 0x2000-0xFFFF when the EA pin is LOW, or from 0x0000-0xFFFF when the EA pin is HIGH.
34	28		BKPT	Output	L	<b>Breakpoint.</b> This pin goes active (HIGH) when the 8051 address bus matches the BPADDRH/L registers and breakpoints are enabled in the BREAKPT register (BPEN=1). If the BPPULSE bit in the BREAKPT register is HIGH, this signal pulses HIGH for eight 12/24/48-MHz clocks. If the BPPULSE bit is LOW, the signal remains HIGH until the 8051 clears the BREAK bit (by writing 1 to it) in the BREAKPT register.
99	77	49	RESET#	Input	N/A	<b>Active LOW Reset.</b> Resets the entire chip. This pin is normally tied to V <sub>CC</sub> through a 100K resistor, and to GND through a 0.1-μF capacitor.

**Table 4-1. FX2 Pin Descriptions (continued)**

<b>128</b>	<b>100</b>	<b>56</b>	<b>Name</b>	<b>Type</b>	<b>Default</b>	<b>Description</b>
35			EA	Input	N/A	<b>External Access.</b> This pin determines where the 8051 fetches code between addresses 0x0000 and 0x1FFF. If EA=0 the 8051 fetches this code from its internal RAM. If EA=1 the 8051 fetches this code from external memory.
12	11	12	XIN	Input	N/A	<b>Crystal Input.</b> Connect this signal to a 24-MHz parallel-resonant, fundamental mode crystal and 20-pF capacitor to GND.
11	10	11	XOUT	Output	N/A	<b>Crystal Output.</b> Connect this signal to a 24-MHz parallel-resonant, fundamental mode crystal and 20-pF capacitor to GND.
1	100	5	CLKOUT	O/Z	48 MHz	12-, 24- or 48-MHz clock, phase locked to the 24-MHz input clock. Output frequency is set by an external EEPROM bit (Config3.2). If no EEPROM is connected to the I <sup>2</sup> C compatible port (but the required pull-up resistors are present), the 8051 defaults to 48-MHz operation. The 8051 may three-state this output by setting CPUCS.1=1. The CLKOUT pin may be inverted by setting the boot EEPROM bit CONFIG0.1=1.

**Port A**

82	67	40	PA0 or INT0#	I/O/Z	I (PA0)	Multiplexed pin whose function is selected by: PORTACFG.0 <b>PA0</b> is a bidirectional IO port pin. <b>INT0#</b> is the active-LOW 8051 INT0 interrupt input signal, which is either edge triggered (IT0 = 1) or level triggered (IT0 = 0).
83	68	41	PA1 or INT1#	I/O/Z	I (PA1)	Multiplexed pin whose function is selected by: PORTACFG.1 <b>PA1</b> is a bidirectional IO port pin. <b>INT1#</b> is the active-LOW 8051 INT1 interrupt input signal, which is either edge triggered (IT1 = 1) or level triggered (IT1 = 0).
84	69	42	PA2 or SLOE	I/O/Z	I (PA2)	Multiplexed pin whose function is selected by two bits: IFCONFIG[1:0]. <b>PA2</b> is a bidirectional IO port pin. <b>SLOE</b> is an input-only output enable with programmable polarity (FIFOPOOLAR.4) for the slave FIFOs connected to FD[0..7] or FD[0..15].
85	70	43	PA3 or WU2	I/O/Z	I (PA3)	Multiplexed pin whose function is selected by: WAKEUP.7 and OEA.3 <b>PA3</b> is a bidirectional I/O port pin. <b>WU2</b> is an alternate source for <b>USB Wakeup</b> , enabled by WU2EN bit (WAKEUP.1) and polarity set by WU2POL (WAKEUP.4). If the 8051 is in suspend and WU2EN=1, a transition on this pin starts up the oscillator and interrupts the 8051 to allow it to exit the suspend mode. Asserting this pin inhibits the chip from suspending, if WU2EN=1.
89	71	44	PA4 or FIFOADR0	I/O/Z	I (PA4)	Multiplexed pin whose function is selected by the following bits: IF-CONFIG[1..0]. <b>PA4</b> is a bidirectional I/O port pin. <b>FIFOADR0</b> is an input-only address select for the slave FIFOs connected to FD[0..7] or FD[0..15].
90	72	45	PA5 or FIFOADR1	I/O/Z	I (PA5)	Multiplexed pin whose function is selected by the following bits: IF-CONFIG[1..0]. <b>PA5</b> is a bidirectional I/O port pin. <b>FIFOADR1</b> is an input-only address select for the slave FIFOs connected to FD[0..7] or FD[0..15].

**Table 4-1. FX2 Pin Descriptions (continued)**

<b>128</b>	<b>100</b>	<b>56</b>	<b>Name</b>	<b>Type</b>	<b>Default</b>	<b>Description</b>
91	73	46	PA6 or PKTEND	I/O/Z	I (PA6)	Multiplexed pin whose function is selected by the IFCONFIG[1:0] bits. <b>PA6</b> is a bidirectional I/O port pin. <b>PKTEND</b> is an input-only packet end with programmable polarity (FIFOPOLAR.5) for the slave FIFOs connected to FD[0..7] or FD[0..15].
92	74	47	PA7 or FLAGD	I/O/Z	I (PA7)	Multiplexed pin whose function is selected by the IFCONFIG[1:0] and PORTACFG.7 bits. <b>PA7</b> is a bidirectional I/O port pin. <b>FLAGD</b> is a programmable slave-FIFO output status flag signal.
<b>Port B</b>						
44	34	25	PB0 or FD[0]	I/O/Z	I (PB0)	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. <b>PB0</b> is a bidirectional I/O port pin. <b>FD[0]</b> is the bidirectional FIFO/GPIF data bus.
45	35	26	PB1 or FD[1]	I/O/Z	I (PB1)	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. <b>PB1</b> is a bidirectional I/O port pin. <b>FD[1]</b> is the bidirectional FIFO/GPIF data bus.
46	36	27	PB2 or FD[2]	I/O/Z	I (PB2)	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. <b>PB2</b> is a bidirectional I/O port pin. <b>FD[2]</b> is the bidirectional FIFO/GPIF data bus.
47	37	28	PB3 or TXD1 or FD[3]	I/O/Z	I (PB3)	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. <b>PB3</b> is a bidirectional I/O port pin. <b>FD[3]</b> is the bidirectional FIFO/GPIF data bus.
54	44	29	PB4 or FD[4]	I/O/Z	I (PB4)	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. <b>PB4</b> is a bidirectional I/O port pin. <b>FD[4]</b> is the bidirectional FIFO/GPIF data bus.
55	45	30	PB5 or FD[5]	I/O/Z	I (PB5)	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. <b>PB5</b> is a bidirectional I/O port pin. <b>FD[5]</b> is the bidirectional FIFO/GPIF data bus.
56	46	31	PB6 or FD[6]	I/O/Z	I (PB6)	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. <b>PB6</b> is a bidirectional I/O port pin. <b>FD[6]</b> is the bidirectional FIFO/GPIF data bus.
57	47	32	PB7 or FD[7]	I/O/Z	I (PB7)	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. <b>PB7</b> is a bidirectional I/O port pin. <b>FD[7]</b> is the bidirectional FIFO/GPIF data bus.
<b>PORT C</b>						
72	57		PC0 or GPIFADR0	I/O/Z	I (PC0)	Multiplexed pin whose function is selected by PORTCCFG.0 <b>PC0</b> is a bidirectional I/O port pin. <b>GPIFADR0</b> is a GPIF address output pin.
73	58		PC1 or GPIFADR1	I/O/Z	I (PC1)	Multiplexed pin whose function is selected by PORTCCFG.1 <b>PC1</b> is a bidirectional I/O port pin. <b>GPIFADR1</b> is a GPIF address output pin.
74	59		PC2 or GPIFADR2	I/O/Z	I (PC2)	Multiplexed pin whose function is selected by PORTCCFG.2 <b>PC2</b> is a bidirectional I/O port pin. <b>GPIFADR2</b> is a GPIF address output pin.

**Table 4-1. FX2 Pin Descriptions (continued)**

<b>128</b>	<b>100</b>	<b>56</b>	<b>Name</b>	<b>Type</b>	<b>Default</b>	<b>Description</b>
75	60		PC3 or GPIFADR3	I/O/Z	I (PC3)	Multiplexed pin whose function is selected by PORTCCFG.3 <b>PC3</b> is a bidirectional I/O port pin. <b>GPIFADR3</b> is a GPIF address output pin.
76	61		PC4 or GPIFADR4	I/O/Z	I (PC4)	Multiplexed pin whose function is selected by PORTCCFG.4 <b>PC4</b> is a bidirectional I/O port pin. <b>GPIFADR4</b> is a GPIF address output pin.
77	62		PC5 or GPIFADR5	I/O/Z	I (PC5)	Multiplexed pin whose function is selected by PORTCCFG.5 <b>PC5</b> is a bidirectional I/O port pin. <b>GPIFADR5</b> is a GPIF address output pin.
78	63		PC6 or GPIFADR6	I/O/Z	I (PC6)	Multiplexed pin whose function is selected by PORTCCFG.6 <b>PC6</b> is a bidirectional I/O port pin. <b>GPIFADR6</b> is a GPIF address output pin.
79	64		PC7 or GPIFADR7	I/O/Z	I (PC7)	Multiplexed pin whose function is selected by PORTCCFG.7 <b>PC7</b> is a bidirectional I/O port pin. <b>GPIFADR7</b> is a GPIF address output pin.

**PORT D**

102	80	52	PD0 or FD[8]	I/O/Z	I (PD0)	Multiplexed pin whose function is selected by the IFCONFIG[1..0] and EPxFIFCFG.0 (wordwide) bits. <b>FD[8]</b> is the bidirectional FIFO/GPIF data bus.
103	81	53	PD1 or FD[9]	I/O/Z	I (PD1)	Multiplexed pin whose function is selected by the IFCONFIG[1..0] and EPxFIFCFG.0 (wordwide) bits. <b>FD[9]</b> is the bidirectional FIFO/GPIF data bus.
104	82	54	PD2 or FD[10]	I/O/Z	I (PD2)	Multiplexed pin whose function is selected by the IFCONFIG[1..0] and EPxFIFCFG.0 (wordwide) bits. <b>FD[10]</b> is the bidirectional FIFO/GPIF data bus.
105	83	55	PD3 or FD[11]	I/O/Z	I (PD3)	Multiplexed pin whose function is selected by the IFCONFIG[1..0] and EPxFIFCFG.0 (wordwide) bits. <b>FD[11]</b> is the bidirectional FIFO/GPIF data bus.
121	95	56	PD4 or FD[12]	I/O/Z	I (PD4)	Multiplexed pin whose function is selected by the IFCONFIG[1..0] and EPxFIFCFG.0 (wordwide) bits. <b>FD[12]</b> is the bidirectional FIFO/GPIF data bus.
122	96	1	PD5 or FD[13]	I/O/Z	I (PD5)	Multiplexed pin whose function is selected by the IFCONFIG[1..0] and EPxFIFCFG.0 (wordwide) bits. <b>FD[13]</b> is the bidirectional FIFO/GPIF data bus.
123	97	2	PD6 or FD[14]	I/O/Z	I (PD6)	Multiplexed pin whose function is selected by the IFCONFIG[1..0] and EPxFIFCFG.0 (wordwide) bits. <b>FD[14]</b> is the bidirectional FIFO/GPIF data bus.
124	98	3	PD7 or FD[15]	I/O/Z	I (PD7)	Multiplexed pin whose function is selected by the IFCONFIG[1..0] and EPxFIFCFG.0 (wordwide) bits. <b>FD[15]</b> is the bidirectional FIFO/GPIF data bus.

**Port E**

108	86		PE0 or T0OUT	I/O/Z	I (PE0)	Multiplexed pin whose function is selected by the PORTECFG.0 bit. <b>PE0</b> is a bidirectional I/O port pin. <b>T0OUT</b> is an active-HIGH signal from 8051 Timer-counter0. T0OUT outputs a high level for one CLKOUT clock cycle when Timer0 overflows. If Timer0 is operated in Mode 3 (two separate timer/counters), T0OUT is active when the low byte timer/counter overflows.
109	87		PE1 or T1OUT	I/O/Z	I (PE1)	Multiplexed pin whose function is selected by the PORTECFG.1 bit. <b>PE1</b> is a bidirectional I/O port pin. <b>T1OUT</b> is an active-HIGH signal from 8051 Timer-counter1. T1OUT outputs a high level for one CLKOUT clock cycle when Timer1 overflows. If Timer1 is operated in Mode 3 (two separate timer/counters), T1OUT is active when the low byte timer/counter overflows.

**Table 4-1. FX2 Pin Descriptions (continued)**

<b>128</b>	<b>100</b>	<b>56</b>	<b>Name</b>	<b>Type</b>	<b>Default</b>	<b>Description</b>
110	88		PE2 or T2OUT	I/O/Z	I (PE2)	Multiplexed pin whose function is selected by the PORTECFG.2 bit. <b>PE2</b> is a bidirectional I/O port pin. <b>T2OUT</b> is the active-HIGH output signal from 8051 Timer2. T2OUT is active (HIGH) for one clock cycle when Timer/Counter 2 overflows.
111	89		PE3 or RXD0OUT	I/O/Z	I (PE3)	Multiplexed pin whose function is selected by the PORTECFG.3 bit. <b>PE3</b> is a bidirectional I/O port pin. <b>RXD0OUT</b> is an active-HIGH signal from 8051 UART0. If RXD0OUT is selected and UART0 is in Mode 0, this pin provides the output data for UART0 only when it is in sync mode. Otherwise it is a 1.
112	90		PE4 or RXD1OUT	I/O/Z	I (PE4)	Multiplexed pin whose function is selected by the PORTECFG.4 bit. <b>PE4</b> is a bidirectional I/O port pin. <b>RXD1OUT</b> is an active-HIGH output from 8051 UART1. When RXD1OUT is selected and UART1 is in Mode 0, this pin provides the output data for UART1 only when it is in sync mode. In Modes 1, 2, and 3, this pin is HIGH.
113	91		PE5 or INT6	I/O/Z	I (PE5)	Multiplexed pin whose function is selected by the PORTECFG.5 bit. <b>PE5</b> is a bidirectional I/O port pin. <b>INT6</b> is the 8051 INT5 interrupt request input signal. The INT6 pin is edge-sensitive, active HIGH.
114	92		PE6 or T2EX	I/O/Z	I (PE6)	Multiplexed pin whose function is selected by the PORTECFG.6 bit. <b>PE6</b> is a bidirectional I/O port pin. <b>T2EX</b> is an active-high input signal to the 8051 Timer2. T2EX reloads timer 2 on its falling edge. T2EX is active only if the EXEN2 bit is set in T2CON.
115	93		PE7 or GPIFADR8	I/O/Z	I (PE7)	Multiplexed pin whose function is selected by the PORTECFG.7 bit. <b>PE7</b> is a bidirectional I/O port pin. <b>GPIFADR8</b> is a GPIF address output pin.
<hr/>						
4	3	8	RDY0 or SLRD	Input	N/A	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. <b>RDY0</b> is a GPIF input signal. <b>SLRD</b> is the input-only read strobe with programmable polarity (FIFOPOOLAR.3) for the slave FIFOs connected to FDI[0..7] or FDI[0..15].
5	4	9	RDY1 or SLWR	Input	N/A	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. <b>RDY1</b> is a GPIF input signal.. <b>SLWR</b> is the input-only write strobe with programmable polarity (FIFOPOOLAR.2) for the slave FIFOs connected to FDI[0..7] or FDI[0..15].
6	5		RDY2	Input	N/A	<b>RDY2</b> is a GPIF input signal.
7	6		RDY3	Input	N/A	<b>RDY3</b> is a GPIF input signal.
8	7		RDY4	Input	N/A	<b>RDY4</b> is a GPIF input signal.
9	8		RDY5	Input	N/A	<b>RDY5</b> is a GPIF input signal.
69	54	36	CTL0 or FLAGA	Output	H	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. <b>CTL0</b> is a GPIF control output. <b>FLAGA</b> is a programmable slave-FIFO output status flag signal. Defaults to PRGFLAG for the FIFO selected by the FIFOADR[1:0] pins.

**Table 4-1. FX2 Pin Descriptions (continued)**

<b>128</b>	<b>100</b>	<b>56</b>	<b>Name</b>	<b>Type</b>	<b>Default</b>	<b>Description</b>
70	55	37	CTL1 or FLAGB	Output	H	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. <b>CTL1</b> is a GPIF control output. <b>FLAGB</b> is a programmable slave-FIFO output status flag signal. Defaults to FULL for the FIFO selected by the FIFOADR[1:0] pins.
71	56	38	CTL2 or FLAGC	Output	H	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. <b>CTL2</b> is a GPIF control output. <b>FLAGC</b> is a programmable slave-FIFO output status flag signal. Defaults to EMPTY for the FIFO selected by the FIFOADR[1:0] pins.
66	51		CTL3	Output	H	<b>CTL3</b> is a GPIF control output.
67	52		CTL4	Output	H	<b>CTL4</b> is a GPIF control output.
98	76		CTL5	Output	H	<b>CTL5</b> is a GPIF control output.
32	26	20	IFCLK	I/O/Z	Z	Interface Clock, used for synchronously clocking data into or out of the slave FIFOs. IFCLK also serves as a timing reference for all slave FIFO control signals and GPIF. When internal clocking, IFCONFIG.7=1, is used the IFCLK pin can be configured to output 30/48 MHz by bits IFCONFIG.5 and IFCONFIG.6 and may be inverted by setting the bit IFCONFIG.4=1.
28	22		INT4	Input	N/A	<b>INT4</b> is the 8051 INT4 interrupt request input signal. The INT4 pin is edge-sensitive, active HIGH.
106	84		INT5#	Input	N/A	<b>INT5#</b> is the 8051 INT5 interrupt request input signal. The INT5 pin is edge-sensitive, active LOW.
31	25		T2	Input	N/A	<b>T2</b> is the active-HIGH T2 input signal to 8051 Timer2, which provides the input to Timer2 when C/T2=1. When C/T2=0, Timer2 does not use this pin.
30	24		T1	Input	N/A	<b>T1</b> is the active-HIGH T1 signal for 8051 Timer1, which provides the input to Timer1 when C/T1 is 1. When C/T1 is 0, Timer1 does not use this bit.
29	23		T0	Input	N/A	<b>T0</b> is the active-HIGH T0 signal for 8051 Timer0, which provides the input to Timer0 when C/T0 is 1. When C/T0 is 0, Timer0 does not use this bit.
53	43		RXD1	Input	N/A	<b>RXD1</b> is an active-HIGH input signal for 8051 UART1, which provides data to the UART in all modes.
52	42		TXD1	Output	H	<b>TXD1</b> is an active-HIGH output pin from 8051 UART1, which provides the output clock in sync mode, and the output data in async mode.
51	41		RXD0	Input	N/A	<b>RXD0</b> is the active-HIGH RXD0 input to 8051 UART0, which provides data to the UART in all modes.
50	40		TXD0	Output	H	<b>TXD0</b> is the active-HIGH TXD0 output from 8051 UART0, which provides the output clock in sync mode, and the output data in async mode.
42			CS#	Output	H	<b>CS#</b> is the active-LOW chip select for external memory. If the CS# signal is used, it should be externally pulled up to V <sub>CC</sub> to ensure that the chip select is inactive (HIGH) at power-on.
41	32		WR#	Output	H	<b>WR#</b> is the active-LOW write strobe output for external memory. If the WR# signal is used, it should be externally pulled up to V <sub>CC</sub> to ensure that the write strobe is inactive at power-on.
40	31		RD#	Output	H	<b>RD#</b> is the active-LOW read strobe output for external memory. If the RD# signal is used, it should be externally pulled up to V <sub>CC</sub> to ensure that the read strobe is inactive at power-on.

**Table 4-1. FX2 Pin Descriptions (continued)**

<b>128</b>	<b>100</b>	<b>56</b>	<b>Name</b>	<b>Type</b>	<b>Default</b>	<b>Description</b>
			OE#	Output	H	<b>OE#</b> is the active-LOW output enable for external memory. If the OE# signal is used, it should be externally pulled up to V <sub>CC</sub> to ensure that the output enable is inactive at power-on.
38						
33	27	21	Reserved	Input	N/A	Reserved. Connect to ground.
101	79	51	WAKEUP	Input	N/A	<b>USB Wakeup.</b> If the 8051 is in suspend, asserting this pin starts up the oscillator and interrupts the 8051 to allow it to exit the suspend mode. Holding WAKEUP asserted inhibits the EZ-USB chip from suspending. This pin has programmable polarity (WAKEUP.4).
36	29	22	SCL	OD	Z	<b>Clock for the I<sup>2</sup>C compatible interface.</b> Connect to V <sub>CC</sub> with a 2.2K resistor, <b>even if no I<sup>2</sup>C compatible peripheral is attached.</b>
37	30	23	SDA	OD	Z	<b>Data for I<sup>2</sup>C compatible interface.</b> Connect to V <sub>CC</sub> with a 2.2K resistor, <b>even if no I<sup>2</sup>C compatible peripheral is attached.</b>
2	1	6	V <sub>CC</sub>	Power	N/A	V <sub>CC</sub> . Connect to 3.3V power source.
17	16	14	V <sub>CC</sub>	Power	N/A	V <sub>CC</sub> . Connect to 3.3V power source.
26	20	18	V <sub>CC</sub>	Power	N/A	V <sub>CC</sub> . Connect to 3.3V power source.
43	33	24	V <sub>CC</sub>	Power	N/A	V <sub>CC</sub> . Connect to 3.3V power source.
48	38	34	V <sub>CC</sub>	Power	N/A	V <sub>CC</sub> . Connect to 3.3V power source.
64	49	39	V <sub>CC</sub>	Power	N/A	V <sub>CC</sub> . Connect to 3.3V power source.
68	53	50	V <sub>CC</sub>	Power	N/A	V <sub>CC</sub> . Connect to 3.3V power source.
81	66		V <sub>CC</sub>	Power	N/A	V <sub>CC</sub> . Connect to 3.3V power source.
100	78		V <sub>CC</sub>	Power	N/A	V <sub>CC</sub> . Connect to 3.3V power source.
107	85		V <sub>CC</sub>	Power	N/A	V <sub>CC</sub> . Connect to 3.3V power source.
3	2	4	GND	Ground	N/A	Ground.
20	19	7	GND	Ground	N/A	Ground.
27	21	17	GND	Ground	N/A	Ground.
49	39	19	GND	Ground	N/A	Ground.
58	48	33	GND	Ground	N/A	Ground.
65	50	35	GND	Ground	N/A	Ground.
80	65	48	GND	Ground	N/A	Ground.
93	75		GND	Ground	N/A	Ground.
116	94		GND	Ground	N/A	Ground.
125	99		GND	Ground	N/A	Ground.
14	13		NC	N/A	N/A	No-connect. This pin must be left open.
15	14		NC	N/A	N/A	No-connect. This pin must be left open.
16	15		NC	N/A	N/A	No-connect. This pin must be left open.

## 5.0 Register Summary

FX2 register bit definitions are described in the FX2 TRM in greater detail.

**Table 5-1. FX2 Register Summary**

Hex	Size	Name	Description	D7	D6	D5	D4	D3	D2	D1	D0	Default	Access

## 6.0 Absolute Maximum Ratings

Storage Temperature .....	-65°C to +150°C
Ambient Temperature with Power Supplied .....	0°C to +70°C
Supply Voltage to Ground Potential .....	-0.5V to +4.0V
DC Input Voltage to Any Pin.....	TBD
DC Voltage Applied to Outputs in High Z State.....	-0.5V to V <sub>CC</sub> +0.5V
Power Dissipation.....	TBD mW
Static Discharge Voltage .....	>2000V
Latch-up Current.....	>TBD mA
Max Output Current, per IO port.....	10 mA
Max Output Current, all five IO ports (128- and 100-pin packages) .....	50 mA

## 7.0 Operating Conditions

T <sub>A</sub> (Ambient Temperature Under Bias).....	0°C to +70°C
Supply Voltage .....	+3.0V to +3.6V
Ground Voltage .....	0V
F <sub>Osc</sub> (Oscillator or Crystal Frequency) .....	24 MHz ± 100 ppm

## 8.0 DC Characteristics

**Table 8-1. DC Characteristics**

Parameter	Description	Conditions	Min.	Typ.	Max.	Unit
V <sub>CC</sub>	Supply Voltage		3.0		3.6	V
V <sub>IH</sub>	Input High Voltage		2		5.25	V
V <sub>IL</sub>	Input Low Voltage		-0.5		0.8	V
I <sub>I</sub>	Input Leakage Current	0 < V <sub>IN</sub> < V <sub>CC</sub>			±10	µA
V <sub>OH</sub>	Output Voltage High	I <sub>OUT</sub> = 4 mA	2.4			V
V <sub>OL</sub>	Output Low Voltage	I <sub>OUT</sub> = -4 mA			0.4	V
I <sub>OH</sub>	Output Current High				4	mA
I <sub>OL</sub>	Output Current Low				4	mA
C <sub>IN</sub>	Input Pin Capacitance				10	pF
I <sub>SUSP</sub>	Suspend Current	includes 1.5k internal pull-up		250	400	µA
I <sub>CC</sub>	Supply Current	8051 running, connected to USB		128	TBD	mA

**Table 8-2. USB Transceiver**

USB 1.1/2.0 compliant.

## 9.0 AC Electrical Characteristics

### 9.1 USB Transceiver

USB 2.0 compliant in full and high speed.

### 9.2 Program Memory Read

f1\_8051\_pgmemrd.vs

**Figure 9-1. Program Memory Read Timing Diagram**

**Table 9-1. Program Memory Read Parameters**

Parameter	Description	Min.	Typ.	Max.	Unit	Notes
t <sub>CL</sub>	1/CLKOUT Frequency		20.83		ns	48 MHz
			41.66		ns	24 MHz
			83.2		ns	12 MHz
t <sub>AV</sub>	Delay from Clock to Valid Address	0		11	ns	
t <sub>STBL</sub>	Clock to PSEN Low	0		6.3	ns	
t <sub>STBH</sub>	Clock to PSEN High	0		6.3	ns	
t <sub>DSU</sub>	Data Set-up to Clock			4	ns	
t <sub>DH</sub>	Data Hold Time	0			ns	

**Notes:**

1. CLKOUT is shown with positive polarity.
2. t<sub>ACC1</sub> is computed from the above parameters as follows:  
 $t_{ACC1}(24 \text{ MHz}) = 3*t_{CL} - t_{AV} - t_{DSU} = 106 \text{ ns}$   
 $t_{ACC1}(48 \text{ MHz}) = 3*t_{CL} - t_{AV} - t_{DSU} = 44 \text{ ns}$

### 9.3 Data Memory Read

**Figure 9-2. Data Memory Read Timing Diagram**

**Table 9-2. Data Memory Read Parameters**

Parameter	Description	Min.	Typ.	Max.	Unit	Notes
t <sub>CL</sub>	1/CLKOUT Frequency		20.83		ns	48 MHz
			41.66		ns	24 MHz
			83.2		ns	12 MHz
t <sub>AV</sub>	Delay from Clock to Valid Address	0		11	ns	
t <sub>STBL</sub>	Clock to RD Low	0		9.3	ns	
t <sub>STBH</sub>	Clock to RD High	0		9.3	ns	
t <sub>DSU</sub>	Data Set-up to Clock			4	ns	
t <sub>DH</sub>	Data Hold Time	0			ns	

**Note:**

3. t<sub>ACC2</sub> and t<sub>ACC3</sub> are computed from the above parameters as follows:

$$\begin{aligned} t_{ACC2}(24 \text{ MHz}) &= 3*t_{CL} - t_{AV} - t_{DSU} = 106 \text{ ns} \\ t_{ACC2}(48 \text{ MHz}) &= 3*t_{CL} - t_{AV} - t_{DSU} = 44 \text{ ns} \end{aligned}$$

$$\begin{aligned} t_{ACC3}(24 \text{ MHz}) &= 5*t_{CL} - t_{AV} - t_{DSU} = 188 \text{ ns} \\ t_{ACC3}(48 \text{ MHz}) &= 5*t_{CL} - t_{AV} - t_{DSU} = 85 \text{ ns} \end{aligned}$$

#### 9.4 Data Memory Write

**Figure 9-3. Data Memory Write Timing Diagram**

**Table 9-3. Data Memory Write Parameters**

Parameter	Description	Min.	Max.	Unit	Notes
t <sub>AV</sub>	Delay from Clock to Valid Address	0	11	ns	
t <sub>STBL</sub>	Clock to WR Pulse Low	0	10.2	ns	
t <sub>STBH</sub>	Clock to WR Pulse High	0	10.2	ns	
t <sub>ON1</sub>	Clock to Data Turn-on	0	10.8	ns	
t <sub>OFF1</sub>	Clock to Data Hold Time	2	10.8	ns	

## 9.5 GPIF Synchronous Signals

**Figure 9-4. GPIF Synchronous Signals Timing Diagram**

\* dashed lines denote signals with programmable polarity

**Table 9-4. GPIF Synchronous Signals Parameters<sup>[4, 5]</sup>**

Parameter	Description	Min.	Max.	Unit
t <sub>SRY</sub>	RDY <sub>X</sub> to Clock Set-up Time	17.2		ns
t <sub>RYH</sub>	Clock to RDY <sub>X</sub>	0		ns
t <sub>SGD</sub>	GPIF Data to Clock Set-up Time	5.2		ns
t <sub>DAH</sub>	GPIF Data Hold Time	0		ns
t <sub>XGD</sub>	Clock to GPIF Data Output Propagation Delay		10	ns
t <sub>XCTL</sub>	Clock to CTL <sub>X</sub> Output Propagation Delay		6	ns

**Notes:**

- 4. GPIF asynchronous RDY<sub>X</sub> signals have a minimum set-up time of 50 ns when using internal 48-MHz IFCLK.
- 5. IFCLK must not exceed 48 MHz.

## 9.6 Slave FIFO Synchronous Read

**Figure 9-5. Slave FIFO Synchronous Read Timing Diagram**

\* dashed lines denote signals with programmable polarity

**Table 9-5. Slave FIFO Synchronous Read Parameters<sup>[5]</sup>**

Parameter	Description	Min.	Max.	Unit
$t_{SRD}$	SLRD to Clock Set-up Time	17.2		ns
$t_{RDH}$	Clock to SLRD Hold Time	0		ns
$t_{OEon}$	SLOE Turn-on to FIFO Data Valid		7.5	ns
$t_{OEoff}$	SLOE Turn-off to FIFO Data Hold		7.5	ns
$t_{XFLG}$	Clock to FLAGS Output Propagation Delay		5.3	ns
$t_{XFD}$	Clock to FIFO Data Output Propagation Delay		9.9	ns

## 9.7 Slave FIFO Asynchronous Read

**Figure 9-6. Slave FIFO Asynchronous Read Timing Diagram**

\* dashed lines denote signals with programmable polarity

**Table 9-6. Slave FIFO Asynchronous Read Parameters<sup>[6]</sup>**

Parameter	Description	Min.	Max.	Unit
$t_{RDpwl}$	SLRD Pulse Width Low	50		ns
$t_{RDpwh}$	SLRD Pulse Width High	50		ns
$t_{XFLG}$	SLRD to FLAGS Output Propagation Delay		70	ns
$t_{XFD}$	SLRD to FIFO Data Output Propagation Delay		11.2	ns
$t_{OEon}$	SLOE Turn-on to FIFO Data Valid		7.5	ns
$t_{OEoff}$	SLOE Turn-off to FIFO Data Hold		7.5	ns

**Note:**

6. Slave FIFO asynchronous parameter values are using internal IFCLK setting at 48 MHz.

## 9.8 Slave FIFO Synchronous Write

**Figure 9-7. Slave FIFO Synchronous Write Timing Diagram**

\* dashed lines denote signals with programmable polarity

**Table 9-7. Slave FIFO Synchronous Write Parameters<sup>[5]</sup>**

Parameter	Description	Min.	Max.	Unit
$t_{SWR}$	SLWR to Clock Set-up Time	10.4		ns
$t_{WRH}$	Clock to SLWR Hold Time	0		ns
$t_{SFD}$	FIFO Data to Clock Set-up Time	5.1		ns
$t_{FDH}$	Clock to FIFO Data Hold Time	0		ns
$t_{XFLG}$	Clock to FLAGS Output Propagation Time		5.3	ns

## 9.9 Slave FIFO Asynchronous Write

**Figure 9-8. Slave FIFO Asynchronous Write Timing Diagram**

\* dashed lines denote signals with programmable polarity

**Table 9-8. Slave FIFO Asynchronous Write Parameters<sup>[6]</sup>**

Parameter	Description	Min.	Max.	Unit
$t_{WRpwL}$	SLWR Pulse Low	50		ns
$t_{WRpwH}$	SLWR Pulse High	70		ns
$t_{SFD}$	SLWR to FIFO DATA Set-up Time	2.7		ns
$t_{FDH}$	FIFO DATA to SLWR Hold Time	2.7		ns
$t_{XFD}$	SLWR to FLAGS Output Propagation Delay		70	ns

### 9.10 Slave FIFO Synchronous Packet End Strobe

**Figure 9-9. Slave FIFO Synchronous Packet End Strobe Timing Diagram**

\* dashed lines denote signals with programmable polarity

**Table 9-9. Slave FIFO Synchronous Packet End Strobe Parameters<sup>[5]</sup>**

Parameter	Description	Min.	Max.	Unit
$t_{SPE}$	PKTEND to Clock Set-up Time	10.4		ns
$t_{PEH}$	Clock to PKTEND Hold Time	0		ns
$t_{XFLG}$	Clock to FLAGS Output Propagation Delay		5.3	ns

### 9.11 Slave FIFO Asynchronous Packet End Strobe

**Figure 9-10. Slave FIFO Asynchronous Packet End Strobe Timing Diagram**

\* dashed lines denote signals with programmable polarity

**Table 9-10. Slave FIFO Asynchronous Packet End Strobe Parameters<sup>[6]</sup>**

Parameter	Description	Min.	Max.	Unit
$t_{PEpwL}$	PKTEND Pulse Width Low	50		ns
$t_{PWpwH}$	PKTEND Pulse Width High	50		ns
$t_{XFLG}$	PKTEND to FLAGS Output Propagation Delay		70	ns

### 9.12 Slave FIFO Output Enable

**Figure 9-11. Slave FIFO Output Enable Timing Diagram**

\* dashed lines denote signals with programmable polarity

**Table 9-11. Slave FIFO Output Enable Parameters**

Parameter	Description	Min.	Max.	Unit
$t_{OEon}$	SLOE Assert to FIFO DATA Output		7.5	ns
$t_{OEoff}$	SLOE Deassert to FIFO DATA Hold		7.5	ns

### 9.13 Slave FIFO Address to Flags/Data

**Figure 9-12. Slave FIFO Address to Flags/Data Timing Diagram**

\* dashed lines denote signals with programmable polarity

**Table 9-12. Slave FIFO Address to Flags/Data Parameters**

Parameter	Description	Min.	Max.	Unit
$t_{XFLG}$	FIFOADR[1:0] to FLAGS Output Propagation Delay		9.1	ns
$t_{XFD}$	FIFOADR[1:0] to FIFODATA Output Propagation Delay		13.9	ns

### 9.14 Slave FIFO Synchronous Address

**Figure 9-13. Slave FIFO Synchronous Address Timing Diagram**

**Table 9-13. Slave FIFO Synchronous Address Parameters<sup>[5]</sup>**

Parameter	Description	Min.	Max.	Unit
t <sub>SFA</sub>	FIFOADR[1:0] to Clock Set-up Time	19.2		ns
t <sub>FAH</sub>	Clock to FIFOADR[1:0] Hold Time	0		ns

### 9.15 Slave FIFO Asynchronous Address

**Figure 9-14. Slave FIFO Asynchronous Address Timing Diagram**

\* dashed lines denote signals with programmable polarity

**Table 9-14. Slave FIFO Asynchronous Address Parameters<sup>[6]</sup>**

Parameter	Description	Min.	Max.	Unit
t <sub>SFA</sub>	FIFOADR[1:0] to RD/WR/PKTEND Set-up Time	0		ns
t <sub>FAH</sub>	RD/WR/PKTEND to FIFOADR[1:0] Hold Time	0		ns

## 10.0 Ordering Information

**Table 10-1. Ordering Information**

Ordering Code	Package Type	RAM Size	# Prog I/Os	8051 Address /Data Busses
CY7C68013-128AC	128 TQFP	8K	40	16/8 bit
CY7C68013-100AC	100 TQFP	8K	40	-
CY7C68013-56PVC	56 SSOP	8K	24	-
CY3681	EZ-USB FX2 Xcelerator Development Kit			

Document #: 38-00929-B

## 11.0 Package Diagrams

The FX2 is available in three packages:

- 56-pin SSOP
- 100-pin TQFP
- 128-pin TQFP

**Figure 11-1. 56-Lead Shrunk Small Outline Package O56**

DIMENSIONS ARE IN MILLIMETERS.

**Figure 11-2.** 100-Pin Thin Plastic Quad Flatpack (14 x 20 x 1.4 mm) A101

**Figure 11-3. 128-Lead Thin Plastic Quad Flatpack (14 x 20 x 1.4 mm) A128**

## 12.0 Document Revision History

Table 12-1. Revision History

Description	Date / Revision
First Draft	March 8, 2000
updated 100-pin TQFP pin out	June 23, 2000
added mechanical drawings, timing diagrams, edits throughout	July 24, 2000
edits for pinout(s) naming/description, some DC / AC char.	July 25, 2000
edit pin naming corrections / typos	July 27, 2000
edits, from internal feedback, throughout added register summary updated timing diagrams updated 100-pin mechanical added some DC/AC spec's	July 28-Sept. 14, 2000
edits throughout	November 3, 2000
