

CMOS SINGLE CHIP 4-BIT MICROCOMPUTER WITH A/D CONVERTER AND VFD

MB88510B SERIES

CMOS SINGLE CHIP 4-BIT MICROCOMPUTER WITH A/D CONVERTER AND VFD DRIVER PORT

The Fujitsu MB88510B series CMOS single-chip 4-bit microcomputer family is a up grade version of the conventional MB88500 series. Its architecture and instruction set are super set of the MB88500 series, add on the A/D converter and VFD driver port.

The MB88510B series consists of the MB88514B, MB88515B, MB88516B, and MB88517B. This series contain max. 8K by 8-bit mask ROM (program memory), a 256 by 4-bit static RAM (data memory), max. 54 I/O lines (including a serial port), max. 8-bit resolution 8 channel A/D converter, max. 25 VFD driver port an 8-bit timer/counter, and a clock generator. They are fabricated by the silicon-gate CMOS process, packaged in a 64 pin shrink DIP or 42-pin plastic standard DIP. They operate with a +5 V power supply and a 6 MHz clock with a prescaler (minimum instruction execution time is 2.0µs) over the temperature range of -40 °C to +85 °C.

CMOS technology allows the device to operate with low power dissipation (6 mA max. at 1 MHz), and further the standby function enables data retention with lower current (15  $\mu$ A max. at  $V_{CC}$  = 6 V).

For user's development of the MB88510B series based system, Fujitsu provides the MB88400/500 cross-assembler and host-emulator which run on the CP/M-86 or PC-DOS machines (cross-assembler also run on the Intellec series III MDS), and the MB2115 series evaluation board system, and the MB88518B for MB88514B/MB88515B/MB88516B, MB88PG517B for MB88517B piggyback EPROM evaluation devices which have external 8K x 8-bit EPROM (MBM27C64). These development tools enables users to minimize their development time and cost.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedence circuit.

#### **FEATURES**

• CMOS Single-chip 4-bit Microcomputer

• Program Memory:

o MB88514B : 6 K x 8-bit mask ROM o MB88515B : 8 K x 8-bit mask ROM o MB88516B, MB88517B: 4 K x 8-bit mask ROM

• Data Memory:

o 256 x 4-bit static RAM

• Max. 54 I/O Lines:

o MB88514B, MB88515B:

-R-Port: Four 4-bit parallel I/O, 16 individual input/output ports

-E-Port: Nine 4-bit and a 2-bit parallel output, six 4-bit parallel input, 38 individual output. Following E-Port have another functions:

EO -E24 : P-Channel high voltage(-35V) parallel output for VFD

direct drive

E28-E35 : Analog inputs

E24-E27, E36, : Serial I/O interrupt input, timer/counter input, timing

output, standby release input

#### o MB88516B:

-R-Port: Three 4-bit and a 1-bit parallel I/O, 13 individual input/output ports
-E-Port: Six 4-bit and a 2-bit parallel output, three 4-bit and a 2-bit paraallel input, 14 individual output: Following E-Port have another
functions:

E0-E7, E12-E14: P-Channel high voltage(-35V) parallel output for VFD

direct drive : Analog inputs

E24-E27, E36, : Serial I/O interrupt input, timer/counter input, timing

output, standby release input

#### o MB88517B:

E28-E35

-R-Port: Three 4-bit and a 1-bit parallel I/O, 13 individual input/output ports
-E-Port: Four 4-bit, a 3-bit, and a 2-bit parallel output, a 4-bit, a 3-bit,
and a 2-bit parallel input, 38 individual output. Following E-Port
have another functions:

EO-E7, E12-E18: P-Channel high voltage(-35V) parallel output for VFD

direct drive
E28-E31 : Analog inputs

E17, E26, E27,: Serial I/O interrupt input, timer/counter input, timing

R15, R11 output, standby release input

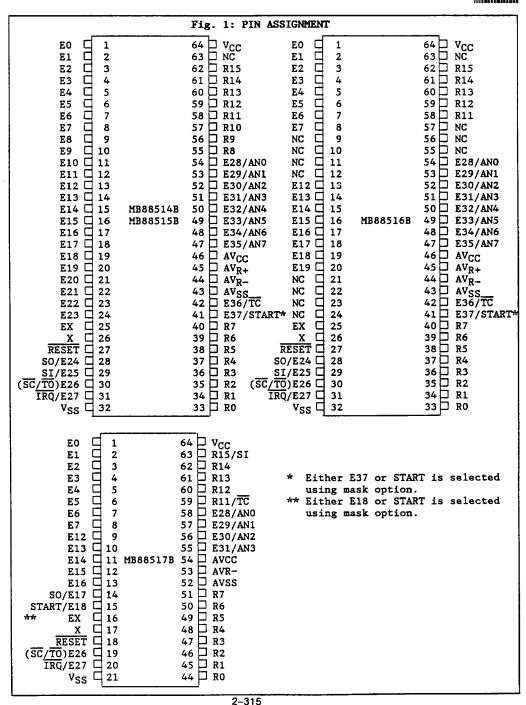

- Four Selectable Output Port Types for E- and R-Ports with Mask Option, Every 4-bit Port:
  - o Standard open-drain
  - o Standard pullup
  - o High-current open-drain
  - o High-current pullup
- 8-bit Programmable Successive Approximation Type A/D Converter with Sample-Hold Circuit:
  - o MB88514B, MB88515B, MB88516B: 8 channel o MB88517B : 4 channel

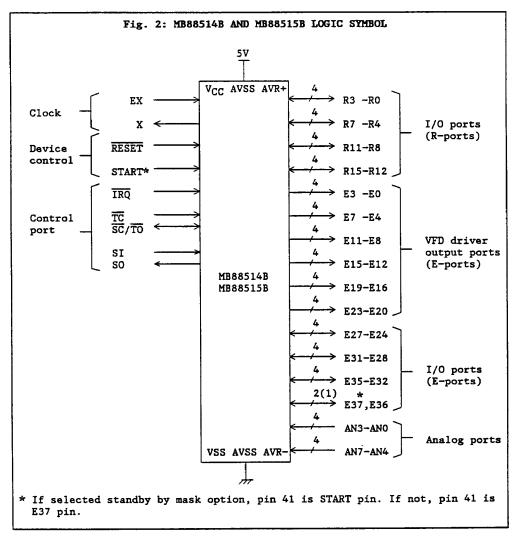

### FEATURES (Continued)

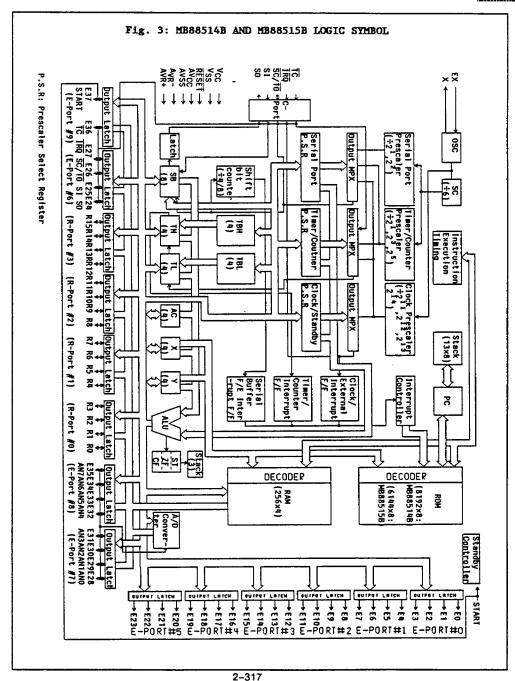

- Mask Option Two Selectable 8 Analog Inputs (MB88514B, MB88515B):
  - o 4 high impedance analog/digital inputs and 4 standard analog inputs/ digital I/O
  - o 8 standard analog inputs/digital I/O
- 8-bit Programmable Timer/Counter with Auto-Loading function/Two Clock Modes:
  - o Internal clock (Timer)
  - o External clock (Counter)
- Software Selectable Serial I/O with 4-/8-bit Serial Buffer/Three Clock Modes:
  - o Internal clock
  - o External clock
  - o Software clock
- On-chip Clock Generator with 2 Mask Options:
  - o External crystal/ceramic resonator or external clock drive
  - o External RC-network or external clock drive
- Mask Option Divide-by-two Clock Prescaler for Expanding Clock Range
- Single Level four Prior Source Maskable Interrupt:
  - o External
  - o Clock
  - o Timer/counter overflow
  - o Serial buffer full/empty
- · 8-nesting Levels for Subroutine Calls
- · Instruction Set : Upward compatible with the MB88500 series
  - o Number of instructions : 81 MB88514B/5B, 79:MB88516B/7B
  - o Instruction length/cycle: 1, 2, or 3 byte(s)/1, 2, or 3 cycle
  - o Execution time : 2.0 µs min. at 3 MHz clock without prescaler
    - (or 6MHz clock with prescaler)
- On-chip Power-on Reset Circuit
- Mask-option Standby Function:
  - o No standby function
  - o Software-initiation standby function
- · Two Mask option Output States During Standby:
  - o Hold
  - o High impedance
- Two Software Selectable Oscillator States During Standby:
  - o Idle
  - o Stop
- Mask Option Standby-off Reset
- Mask Option Watch-dog Timer Function

#### FEATURES (Continued)

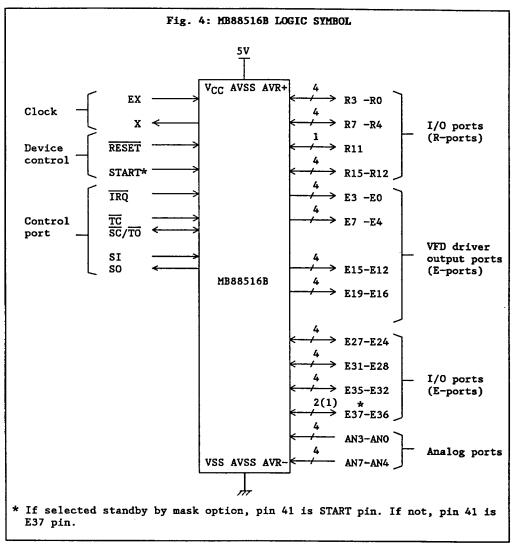

- Low Power Dissipation: o 6 mA at  $V_{CC}$  = 5.5 V at fc = 1 MHz max. (Active mode) o15  $\mu$ A at  $V_{CC}$  = 6.0 V at fc = 0 MHz max. (Standby mode)
- Power Supply o 4.5V to 5.5V (Active mode) o 3.5V to 6.0V (Standby mode)
- Wide operation temperature range:  $T_A$ = -40 °C to +85 °C
- · Silicon Gate CMOS Technology
- Two Package Options:
  - o 64-pin plastic shrink DIP: MB88514B, MB88515B, and MB88516B (Suffix -PSH)
  - o 42-pin plastic standard DIP: MB88517B (Suffix -P)
- Powerful Development Support:
  - o Intellec Series III MDS cross-assembler (SM05215-A010)
  - o CP/M-86 or PC-DOS cross-assembler (SM07415-A012/SMXXXXX-XXXX)
  - o CP/M-86 or PC-DOS host emulator software for monitoring evaluation board and symbolic debugging (SM07415-G022/XXXXXXX-XXXX)
  - o MB2115 series evaluation board (-01, -02, -04, 34, -96, and -92 for MB88514B/5B/6B, MB2115-01, -02, -04, and -38 for MB88517B) for software debugging
  - o MB88518B for MB88514B/5B/6B and MB88PG517B for MB88517B CMOS piggyback EPROM evaluation devices

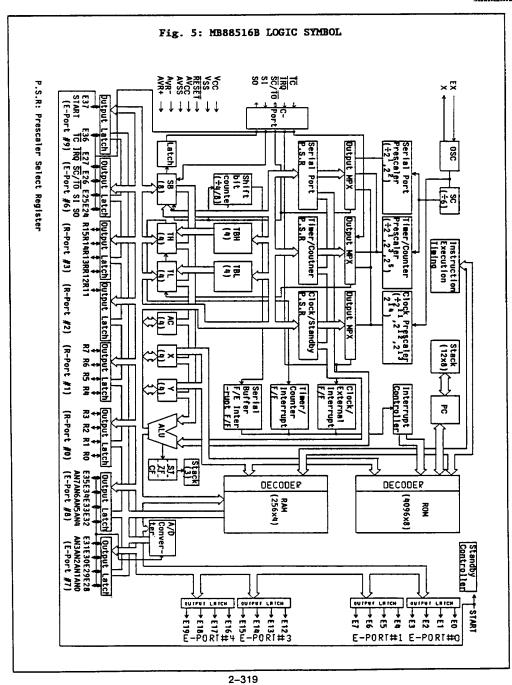

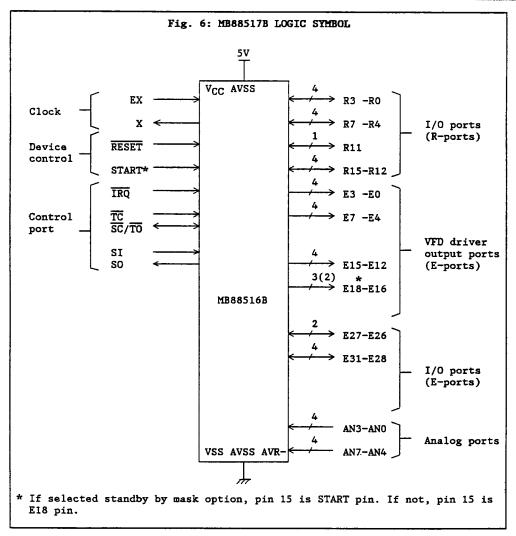

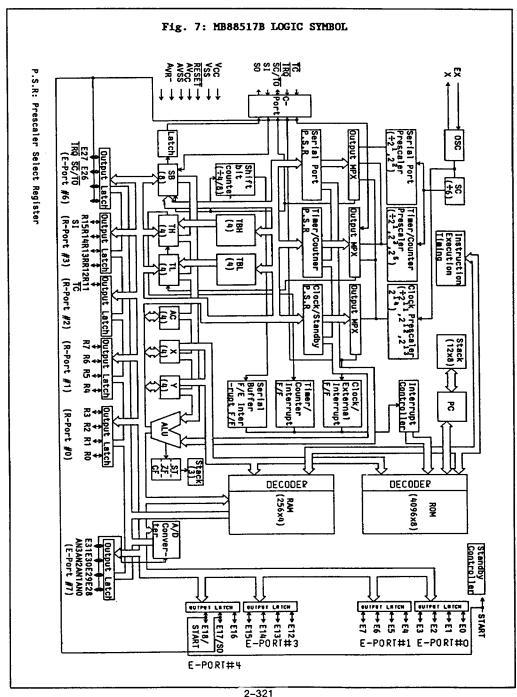

#### PIN DESCRIPTION

Fig. 1 and Table 1 show the pin assignment and pin description of the MB88510B Series.

Table 1: PIN DESCRIPTION

|                             |                      | Pin No. |          |      |   |
|-----------------------------|----------------------|---------|----------|------|---|
| Symbol                      | MB88514B<br>MB88515B |         | MB88517B | Туре | Name & Function   |
| <ul> <li>Power S</li> </ul> | upply                |         |          |      |   |
| v <sub>CC</sub>             | 64                   | 64      | 42       | -    | +5V DC power supply pin.  |
| V <sub>SS</sub>             | 32                   | 32      | 21       | -    | Ground pin.   |
| • Clock                     | ·                    |         |          |      |   |
| EX                          | 25                   | 25      | 16       | Ī    | Oscillator Input: Input to the inverting amplifier that forms the on-chip oscillator. An external crystal/ceramic resonator or RC-network is connected between the EX and X pins. Either of these two oscillation types can be selected using mask option. When an external oscillator is used, the EX pin receives the external oscillator signal.   |
|                             |                      |         |          |      | This pin is a non-hysteresis input when the crystal/ceramic oscillator is selected, and a hysteresis input when the RC-network oscillator is selected.  |
| Х                           | 26                   | 26      | 17       | 0    | Oscillator Output: Output of the inverting amplifier that forms the on-chip oscillator, and input to the internal clock generator. An external crystal/ceramic resonator or RC-network is connected between the EX and X pins. Either of these two oscillator types can be selected using mask option. When an external oscillator is used, the X pin should be left open.  |
| • Device                    | Control              |         |          |      |   |
| RESET                       | 27                   | 27      | 18       | I    | Reset: This pin function as an external reset input or power-on reset output. External reset input: A reset input to the internal reset circuit. A low level on the internal reset circuit. A low level on the RESET pin forcedely stops the MCU's operation, and initializes its internal state. After the RESET pin returns high, the MCU restarts execution of program from address #0. The RESET pulse must be low for at less two instruction cycles while the oscillator is stably running after poweron. This pin is a hysteresis input with an internal pullup resistor. An external capacitor from the RESET pin to the VSS pin (and the internal pull-up resistor), |

Table 1: PIN DESCRIPTION (Continued)

| T          | Pin No.   |    |          |                |  |
|------------|-----------|----|----------|----------------|--|
| Symbol     |           |    | MB88517B | Туре           | Name & Function  |
|            | MB88515B  |    |          |                |  |
| • Device ( | Control ( |    | )        |                |  |
| RESET      | 27        | 27 | 18       | I<br>I/0       | the on-chip reset control circuit.  Normally this output is high during the active operation except the reset mode.  |
|            |           |    |          |                | The rising of the VCC voltage after power on outputs a low level on the RESET pin, and them automatically returns high 2 <sup>18</sup> clock periods after the oscillator starts by power on.  This pin is a hysteresis input with an  |
| CTADT      | λ1.       | 41 | 15       | <del>-</del> - | internal pullup resistor.  |
| START      | 41        | 41 | 15       | Ι              | Start: A standby release input to the internal standby control and status registers that control and monitor the onchip standby control circuit. A high level on the START pin during the standby mode sets the standby release flag (STF) in the standby status register, resets the standby enable flag (STBE) in the standby control register, and triggers the standby release sequence to return the MCU to the active mode. Before the START pulse is applied, the VCC voltage must return to the active operation range when the battery backup is used. Also, the START pin must be low before the standby mode is initiated.  The START pin state (logical level) is reflected in the standby release input (START) flag (STIF) in the stand-by status register, regardless of during the standby mode or active mode, and besides even when the standby function is not implemented using mask option. Therefore, the START pin state can be sensed by reading the standby status register using IN instruction (with Y=8).  This pin is a hysteresis input with an internal pull-down resistor. |

Table 1: PIN DESCRIPTION (Continued)

|          |          | Pin No. |           |      |   |
|----------|----------|---------|-----------|------|---|
| Symbol   | MRSS514R |         | MB88517B  | Type | Name & Function   |
| Jubur    | MB88515B |         | 111003171 | 1,00 | Hame & Lancozon   |
| • C-Port |          |         |           |      |   |
| TRQ      | 31       | 31      | 20        | Ī    | Interrupt Request: A maskable external interrupt input to the on-chip interrupt control circuit. The falling edge of the IRQ pulse sets the external interrupt request flag (IRF) in the interrupt flag register regardless of enabling or disabling the external interrupt. If the external interrupt is enabled in advance by EN instruction, the interrupt sequence starts at once. Otherwise, the IRF flag is internally held as an interrupt source. Also, the IRQ pin state (logical level), which is reflected in the external interrupt input flag (IF) regardless of enabling or disabling the external interrupt, is testable using TSTI instruction. (When IRQ = L, IF = 1; otherwise IF = 0.)   |
|          |          |         |           |      | This pin is a hysteresis input with an internal pullup resistor.  |
| TC       | 42       | 42      | 37        | Ī    | Timer/Counter: An external count clock input to the on-chip 8-bit timer/counter. The falling edge of the TC pulse increments the timer/counter by one bit, when the external count clock (counter) mode is enabled by EN instruction programming the timer/counter prescaler select register using OUT instruction (with Y = B). Also, the TC pin state (logical level), which is reflected in the timer/counter input flag (TCIF) in the timer/counter prescaler select register regardless of enabling or disabling the external count clock (counter mode, is testable by reading the prescaler select register using IN instruction (with Y = B). (When TC = L, TCIF = 1; otherwise TCIF = 0.) This pin is inactive as a count clock input when the external count clock mode is not selected or the timer/counter is disabled by DIS instruction or reset.  This pin is a hysteresis input with an internal pullup resistor. |

Table 1: PIN DESCRIPTION (Continued)

|          | ,         | Pin No. |          |      |  |
|----------|-----------|---------|----------|------|--|
| Symbol   | MB88514B  |         | MB88517B | Type | Name & Function  |
|          | MB88515B  | i       |          | 7.   |  |
| • C-Port | (Continue | i)      |          |      |  |
| SC/TO    | 30        | 30      | 19       | 1/0  | Shift Clock/Timing Output: One of the shift clock input $(\overline{SC})$ , shift clock output $(\overline{SC})$ , or synchronous timing output $(\overline{TO})$ is enabled using EN instruction.   |
|          |           |         |          | I    | SC:1) Shift clock input to the on-chip serial port: When the external shift clock mode is enabled for the serial port, the falling edge of the external SC clock shifts the contents of the internal serial buffer one bit right (from MSB to LSB). This input is inactive when the external clock mode is not selected or the serial port disabled by DIS instruction or reset. This pin is a hysteresis input. |
|          |           |         |          |      | 2) Shift clock output from the on-chip serial port: When the internal shift clock mode is enabled, the internal shift clock shifts the contents of the serial buffer one bit right. In this mode, the internal timing signal selected is output onto the SC pin for synchronization.   |
|          |           |         |          | 0    | TO:Synchronous timing output: When the timing output is enabled, the internal timing signal (which is generated by the on-chip state counter outputs, \$\phi\$ and \$\phi\$2) is output onto the TO pin. By DIS instruction or reset, the TO pin is disabled and stops issuing the timing output.  This pin is a hysteresis input with an internal pullup resistor   |
|          |           |         |          |      |  |
| SI       | 29        | 29      | 41       | I    | Serial Data Input: Data input to the on-<br>chip serial port. The rising edge of the<br>external (SC) or internal shifts the data<br>bit on the SI pin into the MSB of the<br>serial buffer register when the serial<br>port is enabled by EN instruction. Also,   |

## INPUT/OUTPUT CIRCUITS

All input only pins are internally pulled up, and all output only and input/output pins except E- and R-Ports have push-pull output buffer (standard pullup). E- and R-Ports can have push-pull (standard or high-current pullup) or open-drain (standard or high-current) buffer using mask option.

#### NOTES ON OPERATION

#### • Prevention Latch-up

Latch-up may occur in CMOS devices when a voltage higher than  $V_{\rm CC}$  or lower than  $V_{\rm SS}$  is applied to any input or output pin, or when a voltage exceeding the absolute maximum ratings is applied between  $V_{\rm CC}$  and  $V_{\rm SS}$  pins. If latch-up occurs, the supply current increases greatly, and the device may be thermally destroyed. Therefore, applied voltages should not exceed the maximum ratings.

## Treatment of Unused Pins

Unused input pins should be pulled up or down with external resistors or they may cause some malfunction. (However, the X pin should be open when an external clock oscillator is used.)

#### · A/D converter supply

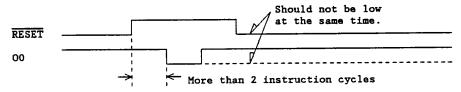

When A/D converter function doesn't used, AVCC and AVSS should be connect the supply and ground.

#### • Special Function of R12 Pin

The R12 pin has another function as a test terminal, in addition to its normal function R-Port. If the R12 pin is forced low while the  $\overline{\text{RESET}}$  pin is low, the MCU is placed in the test mode. Therefore, the R12 pin should not be forced low while the  $\overline{\text{RESET}}$  pin is low (when all output ports are initialized).

Especially when the open-drain is selected for the output port option, the R12 pin should be externally pulled up because such open-drain outputs are subject to noise disturbance if left floating.

At least 2 instruction cycles are required to change R12 pin from high to low after releasing reset ( $\overline{\text{RESET}}$ : Low  $\rightarrow$  High)

### • External Capacitors for Crystal Oscillation

Figs. 11, 19, and 27 gives an aim of an area where the on-chip oscillator has stable oscillator characteristics and short oscillation stabilization time when an average crystal resonator is used.

The external capacitor should be adjusted to individual crystal resonators when precise oscillation frequency is required. It is recommended to use crystal with a frequency higher than required oscillation frequency, together with the on-chip divided-by-two prescaler, because crystal resonators with lower oscillation frequency generally tends to have longer stabilization time and wider characteristics variation.

#### NOTES ON OPERATION

## • Supply Voltage

Malfunction may occur even within the recommended operating supply voltage if the supply voltage changes rapidly. Therefore, the supply voltage should be regulated as well as possible. The following conditions are recommended for the power supply:

- (1)  $V_{CC}$  ripple (peak-to-peak value) at commercial frequency (50Hz to 60Hz): Less than 10% of typical  $V_{CC}$  value.
- (2)  $V_{CC}$  transient change rate (such as at switching of power supply): Less than 0.1V/ms.

\* MB88514B/5B: 81 instruction

MB88516B/7B: 79 instruction

#### INSTRUCTION SET DESCRIPTION

The MB88510B series instruction set includes 81 (79) instructions, 78% of which are single-byte and single-cycle, 19% two-byte two-cycle, 1% two byte three-cycle, and 2% three-byte and three-cycle. The MB88510B series instruction sets is divided into ten functional groups:

• Register-to-register transfer

• Register-to-memory transfer

· Constant transfer

• Arithmetic and logical operations

• Bit manipulation

• Control

• Input/Output

Branch

· Flag manipulation

• Other

Tables 5 and 6 summarize the MB88510B series instruction set.

Table 5: INSTRUCTION SET SUMMARY

| Mnemonic Code Flag/Status Byte/ Operation |       |             |        |     |    |   |       |  |  |  |

#### Notes:

- \*1: ZF is set or reset depending on contents of AC after instruction execution.
- \*2: ZF is set or reset depending on contents of Y after instruction execution.
- \*3: Each bit of the operand (the second byte) functions as follows:

\*4: MB88514B/5B only

## Symbols and Abreviations

| Symbols      | Meaning  |
|--------------|--|
| +            | Is transferred to  |
| <b>*</b>     | Is exchanged with  |
|              | Arithmetic plus  |
| _            | Arithmetic minus   |
| ⊕            | Logical exclusive or   |
| ភ            | Logical OR   |
| +<br>⊕<br>U  | Logical AND  |
| (Overline)   | Negation   |
| ( )          | Contents of perenthesis  |
| <b>^</b>     | Set to "1" always  |
| <b>+</b>     | Set to "0" always  |
|              | Affected (set or reset) by operation results   |
| <b>↓</b> C   | Set to "0" due to carry (not carry flag)   |
| <b>↓CF</b>   | Set to "0" due to carry flag   |
| <b>↓IF</b>   | Set to "0" due to interrupt flag   |
| <b>↓SF</b>   | Set to "0" due to serial buffer full/empty flag                                      |
| <b>↓VF</b>   | Set to U due to timer/counter overflow flag  |
| <b>↓</b> Z   | Set to "0" due to zero (not zero flag)   |
| <b>↓ZF</b>   | Set to "0" due to zero flag  |
| •            | Not affected   |
| Abbreviation | Meaning  |
| AC           | Accumulator  |
| addr         | Jump address   |
| bp           | Bit pointer (that is part of the instruction code)                                   |
| С            | Carry  |
| CF           | Carry flag   |
| đ            | Direct line number (that is part of the instruction code)                            |
| E            | E-Port (#0: E3-E0, #1: E7-E4, #2: E35-E32, #9: E37-E36)                              |
| (R)Y; Y=n    | E-Port #n specified by Y-register (Y=0 to 9)   |
| IF           | Interrupt flag   |
| imm<br>TDO   | Immediate data   |
| IRQ          | Interrupt request  |
| K<br>LSB     | K-Port (K3 to K0)  |
| M(X,Y)       | Least significant bit  |
| 11(21,17)    | Data memory (RAM) location indirectly addressed by data pointer (X- and Y-registers) |
| M(0,D)       | Data memory (RAM) location directly addressed by "D" bits in the                     |
| • • •        | instruction code, in page #0 (X=0)   |
| MSB          | Most significant bit   |
| R            | R-Port (#0: R3-R0, #1: R7-R4, #2: R11-R8, #3: R15-R12)                               |
| (R)Y; Y=n    | R-Port #n specified by Y-register (Y=0 to 3)   |
|              | ② R-Port bit n specified by Y-register (Y=0 to 15)                                   |
| (R)d; d=n    | R-Port bit n specified by "d" bits in the instruction code                           |
| SB           | Serial buffer register   |
| SF           | Serial buffer full/empty flag  |
| ST           | Status flag  |
| TH           | Timer/counter high byte  |
| TL           | Timer/counter low byte   |
| VF<br>V      | Timer/counter overflow flag  |
| X<br>Xn      | X-register (that indicates page # in data memory RAM) The neth bit Y-register        |
| Xn<br>Y      | The n-th bit X-register  |
| Ž            | Y-register<br>Zero 2-339   |
| ZF           | Zero flag  |
|              | o  |

Note: : 3 byte/3 cycle instruction 2-341

## PRODUCT LINE-UP AND DEVELOPMENT TOOLS

The MB88510B series consists of the MB88514B, MB88515B, MB88516B, and MB88517B. The MB88518B are available as piggyback EPROM evaluation devices for MB88514B/5B/6B. MB88PG517B is for the MB88517B. Refer to Table 7.

<sup>†</sup> Permanent device damage may occur if the above ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

| Input Clock<br>Rise/Fall<br>Time | t <sub>cr</sub> , | EX           | External clock<br>drive (with X<br>open)<br>Figs. 8 and 9 | 5    | 200         | ns   |                   |

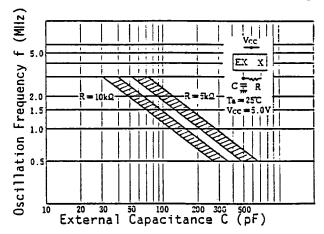

- \* When the RC-network oscillation is used, the following conditions must be met: 1) The prescaler is not used.
  - 2) V<sub>CC</sub>=5V±10%
  - 3)  $T_A = -40$ °C to +85°C
  - 4)  $f_C^{\circ}$  does not exceed 3MHz (Max. setting clock frequency is about 2.4MHz at  $V_{CC}$ =5V and  $T_A$ =25°C.)

2-347

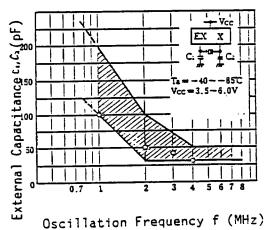

### Note:

When the RC-network oscillations is used, the following conditions must be met: 1) The prescaler is not used. 2)  $V_{CC}=5V\pm10\%$ 

- 3)  $T_A = -40^{\circ}C$  to 85°C
- 4) fc does not exceed 2.4 MHz.

Fig. 11: Crystal Oscillation Characteristics (Example)

#### Note:

- 1) The cross-hatched portion shows an area where the on-chip oscillator has stable oscillation characteristics and short oscillation stabilization time when an average crystal resonator is used. This chart gives an aim value of the external capacitor to realize a desired oscillation frequency. When an exact oscillation frequency is needed, a capacitor value should be determined, adjusting to individual crystal resonator characteristics.
- 2) Generally speaking, crystal resonators with lower oscillation frequency tend to have longer oscillation stabilization time and wider characteristic variations which affect on-chip oscillator characteristics. So, we recommend to use high-frequency crystal resonator with on-chip 1/2 prescaler.

#### Notes:

- 1. Error between analog inputs is within 1/2 LSB when  $AV_{R+}-AV_{R-}=5.0V$
- 2. Full-scale and offset can be adjust by an appropriate setting of  $AV_{R+}$  and  $AV_{R-}$ .
- 3. Error becomes relatively larger as AVR+-AVR- becomes smaller.
- \*1 fc=6.0 MHz (with prescaler)
- \*2 fc=1.0 MHz (without prescaler)

#### Resolution

The minimum variation in an analog signal that can be discriminated by the A/D converter. (An analog voltage can be divided into  $2^8=256$  parts.)

### • Linearity Error

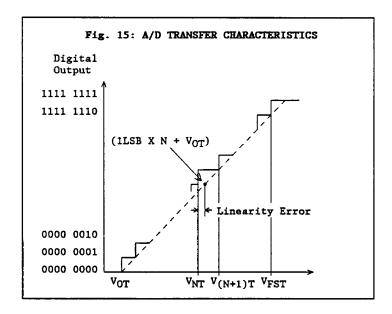

The difference between the line connecting the device zero transition point ("0000 0000"  $\longleftrightarrow$  "0000 0001") with the full scale transition point ("1111 1111"  $\longleftrightarrow$  "1111 1110"), the actual conversion characteristics.

### · Differential Linearity Error

The difference from ideal input voltage required to change the output voltage code by 1LSB. 2-353

### • A/D CONVERTER CHARACTERISTICS (Continues)

$$1LSB = \frac{V_{FST} - V_{OT}}{254}$$
Linearity = 
$$\frac{V_{NT} - (1LSB \times N + V_{OT})}{1LSB}$$
 (LSB)
Differential Linearity = 
$$\frac{V_{(N+1)T} - V_{NT}}{1LSB} - 1$$
 (LSB)

<sup>†</sup> Permanent device damage may occur if the above ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

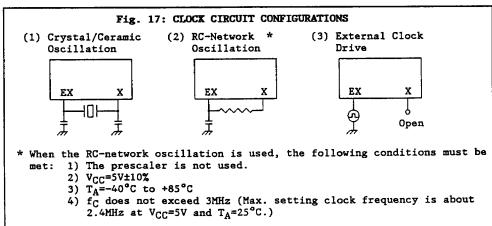

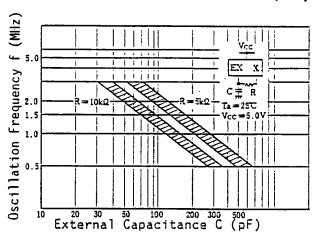

Fig. 18: RC-Network Oscillation Characteristics (Example)

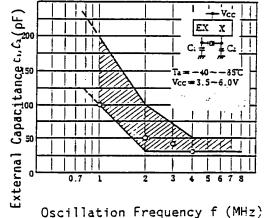

### Note:

When the RC-network oscillations is used, the following conditions must be

1) The prescaler is not used. 2) V<sub>CC</sub>=5V±10%

3)  $T_A=-40$ °C to 85°C 4)  $f_C$  does not exceed 2.4 MHz.

Fig. 19: Crystal Oscillation Characteristics (Example)

#### Note:

- 1) The cross-hatched portion shows an area where the on-chip oscillator has stable oscillation characteristics and short oscillation stabilization time when an average crystal resonator is used. This chart gives an aim value of the external capacitor to realize a desired oscillation frequency. When an exact oscillation frequency is needed, a capacitor value should be determined, adjusting to individual crystal resonator characteristics.
- 2) Generally speaking, crystal resonators with lower oscillation frequency tend to have longer oscillation stabilization time and wider characteristic variations which affect on-chip oscillator characteristics. So, we recommend to use high-frequency crystal resonator with on-chip 1/2 prescaler.

2-359

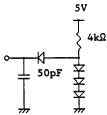

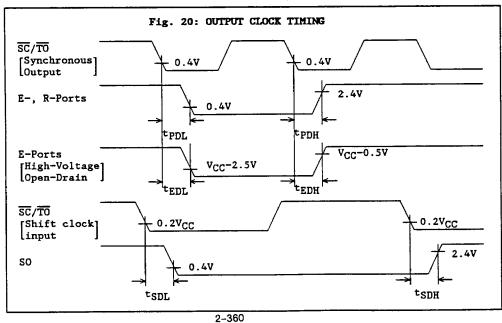

• OUTPUT TIMING (MB88516B)

#### Notes:

- 1. Error between analog inputs is within 1/2 LSB when AVR+-AVR-=5.0V
- 2. Full-scale and offset can be adjust by an appropriate setting of AVR+ and AVR
- 3. Error becomes relatively larger as AVR+-AVR- becomes smaller.
- \*1 fc=6.0 MHz (with prescaler)
- \*2 fc=1.0 MHz (without prescaler)

#### - Resolution

The minimum variation in an analog signal that can be discriminated by the A/D converter. (An analog voltage can be divided into 2\*=256 parts.)

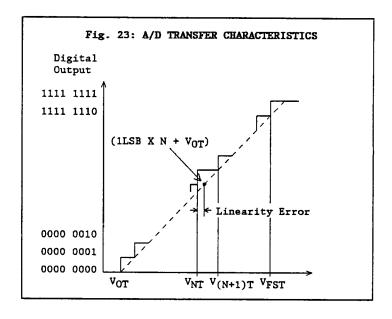

### · Linearity Error

The difference between the line connecting the device zero transition p int ("0000 0000" \( \rightarrow \)"0000 0001") with the full scale transition point ("1111 1111" \( \rightarrow \)"1111 1110"), the actual conversion characteristics.

#### · Differential Linearity Error

The difference from ideal input voltage required to change the output voltage code by 1LSB. 2-364

### • A/D CONVERTER CHARACTERISTICS (Continues)

$$1LSB = \frac{V_{FST} - V_{OT}}{254}$$

$$Linearity = \frac{V_{NT} - (1LSB \times N + V_{OT})}{1LSB} \quad (LSB)$$

$$Differential Linearity = \frac{V_{(N+1)T} - V_{NT}}{1LSB} - 1 \quad (LSB)$$

$$Error$$

<sup>\*1:</sup> Only E18 selected high-voltage port by mask option.

<sup>†</sup> Permanent device damage may occur if the above ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

- \* When the RC network oscillation is used, the following conditions must be met: 1) The prescaler is not used.
  - 2) V<sub>CC</sub>=5V±10%

  - 3)  $T_A = -40$ °C to +85°C 4)  $f_C$  does not exceed 3MHz (Max. setting clock frequency is about 2.4MHz at V<sub>CC</sub>=5V and T<sub>A</sub>=25°C.)

2-369

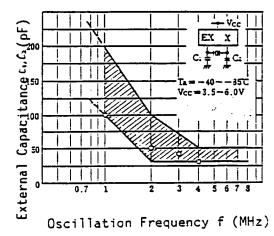

Note:

When the RC-network oscillations is used, the following conditions must be

met: 1) The prescaler is not used. 2)  $V_{CC}=5V\pm10\%$ 

3)  $T_A=-40$ °C to 85°C 4)  $f_C$  does not exceed 2.4 MHz.

Fig. 27: Crystal Oscillation Characteristics (Example)

Note:

- The cross-hatched portion shows an area where the on-chip oscillator has stable oscillation characteristics and short oscillation stabilization time when an average crystal resonator is used. This chart gives an aim value of the external capacitor to realize a desired oscillation frequency. When an exact oscillation frequency is needed, a capacitor value should be determined, adjusting to individual crystal resonator characteristics.
- 2) Generally speaking, crystal resonators with lower oscillation frequency tend to have longer oscillation stabilization time and wider characteristic variations which affect on-chip oscillator characteristics. So, we recommend to use high-frequency crystal resonator with on-chip 1/2 prescaler.

#### Notes:

- 1. Error between analog inputs is within 1/2 LSB when  $AV_{CC}-AV_{R}=5.0V$
- 2. Full-scale and offset can be adjust by an appropriate setting of  $\Delta V_{\rm CC}$  and  $\Delta V_{\rm R-}$  .
- 3. Error becomes relatively larger as AVCC-AVR- becomes smaller.
- \*1 fc=6.0 MHz (with prescaler)
- \*2 fc=1.0 MHz (without prescaler)

### Resolution

The minimum variation in an analog signal that can be discriminated by the A/D converter. (An analog voltage can be divided into 2\*=256 parts.)

#### · Linearity Error

The difference between the line connecting the device zero transition point ("0000 0000" ←→ "0000 0001") with the full scale transition point ("1111 1111" ←→ "1111 1110"), the actual conversion characteristics.

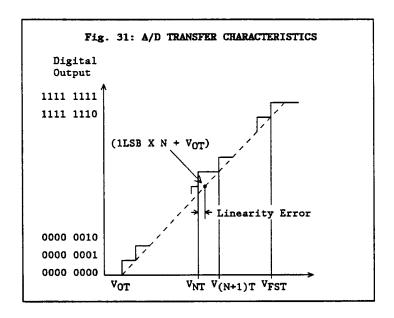

### · Differential Linearity Error

The difference from ideal input voltage required to change the output voltage code by 1LSB.

2-375

### • A/D CONVERTER CHARACTERISTICS (Continues)

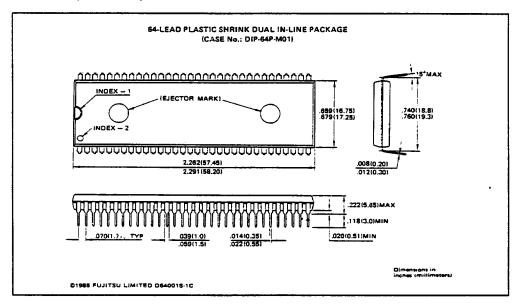

$$1LSB = \frac{V_{FST} - V_{OT}}{254}$$

$$Linearity = \frac{V_{NT} - (1LSB \times N + V_{OT})}{1LSB} \quad (LSB)$$

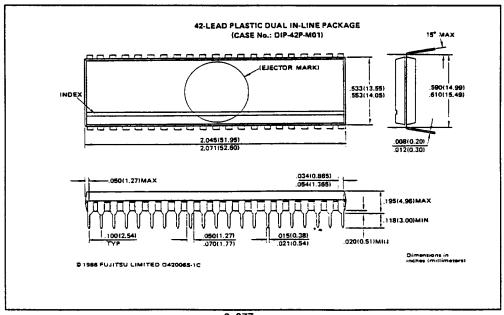

$$Differential Linearity = \frac{V_{(N+1)T} - V_{NT}}{1LSB} - 1 \quad (LSB)$$

#### PACKAGE DIMENSION

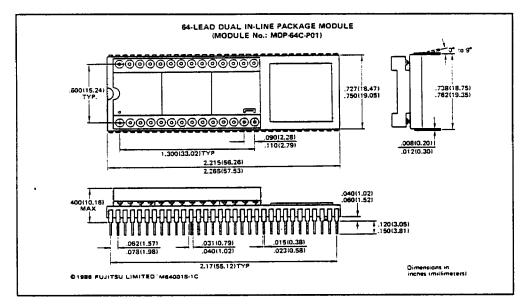

• MB88514B, MB88515B, and MB88516B: 64-PIN PLASTIC SHRINK DIP

• MB88517B: 42-PIN PLASTIC STANDARD DIP

• MB88518B: 64-PIN CERAMIC SHRINK MODULE

• MB88PG517B: 42-PIN CERAMIC MODULE
